Preface

Lightcast is a leading provider of economic impact studies and labor market data to educational institutions, workforce planners, and regional developers in the U.S. and internationally. Since 2000, Lightcast has completed over 3,000 economic impact studies for educational institutions in three countries. Along the way, we have worked to continuously update and improve our methodologies to ensure that they conform to the best practices. The present study reflects the latest version of our model, representing the most up-to-date theory for conducting human capital economic impact analyses.

The model is consistently being updated as more data becomes available. For example, we have improved the accuracy of the Mincer function, a function used to project former students' earnings trajectory as they gain more experience throughout their working lives. We have switched data sources and now use a more accurate and complete data set from IPUMS¹ to calculate our Mincer functions. In addition, the Mincer function is now demographic profile specific, which we are able to apply to the institution's student demographic composition. As part of updating the Mincer, the age at which students reach their career midpoint in earnings was updated.

This model, as with previous versions, has various external data inputs which reflect the most current economic activity and data. These data include (but are not limited to): the taxpayer discount rate; the student discount rate; the consumer savings rate; the consumer price index; national health expenditures; state and local industry earnings as a percent of total industry earnings; income tax brackets and sales tax by state; and unemployment, migration, and life tables. All data sets are maintained quarterly, although most updates occur only once a year.

These and other changes mark a considerable upgrade to the Lightcast economic impact model. Our hope is that these improvements will provide a better product for our clients—reports that are more transparent and streamlined, methodology that is more comprehensive and robust, and findings that are more relevant and meaningful to today's audiences.

While this report is useful in demonstrating the current value of the University of Louisiana Monroe (ULM), it is not intended for comparison with ULM's previous study conducted by Lightcast in 2023. Due to the extent of the improvements to Lightcast's model since 2023, differences between results from the 2023 study and the present study do not necessarily indicate changes in the value of the university.

¹ IPUMS provides census and survey data from around the world integrated across time and space. This data can be accessed through their site: <https://www.ipums.org/>.

Lightcast encourages our readers to approach us directly with any questions or comments they may have about the study so that we can continue to improve our model and keep the public dialogue open about the positive impacts of education.

A note on comparing studies

It is important to note that the changes outlined above represent important improvements to our methodology, ultimately providing more accurate and robust results. However, these changes make it difficult to directly compare past studies to the current study, with the effectiveness of the comparison decreasing as the age of the previous study increases.

Additionally, in general Lightcast discourages comparisons between individual institutions and between educational systems since many factors, such as regional economic and political conditions, institutional differences, and student demographics are outside of the institution's control. In addition, every institution is unique, meaning the results and types of impact or investment measures are tailored to the specific institution or educational system.

Executive summary

This report assesses the impact of the University of Louisiana Monroe (ULM) on the regional economy and the benefits generated by the university for students, taxpayers, and society. The results of this study show that ULM creates a positive net impact on the regional economy and generates a positive return on investment for students, taxpayers, and society.

Economic impact analysis

During the analysis year, ULM spent \$88.5 million on payroll and benefits for 1,019 full-time and part-time employees, and spent another \$59.3 million on goods and services to carry out its day-to-day operations, construction, and research activities. This initial round of spending creates more spending across other businesses throughout the regional economy, resulting in the commonly referred to multiplier effects. This analysis estimates the net economic impact of ULM that directly accounts for the fact that state and local dollars spent on ULM could have been spent elsewhere in the region if not directed toward ULM and would have created impacts regardless. We account for this by estimating the impacts that would have been created from the alternative spending and subtracting the alternative impacts from the spending impacts of ULM.

This analysis shows that in fiscal year (FY) 2023-24, operations, research, entrepreneurial, visitor, and student spending of ULM, together with volunteerism and the enhanced productivity of its alumni, generated **\$617.6 million** in added income for the Northeast Louisiana² economy. The additional income of \$617.6 million created by ULM is equal to approximately **4.5%** of the total gross regional product (GRP) of Northeast Louisiana. For perspective, this impact from the university is nearly as large as the entire Construction industry in the region. The impact of \$617.6 million is equivalent to supporting **10,464 jobs**. For further perspective,

The additional income of **\$617.6 million** created by ULM is equal to approximately **4.5%** of the total gross regional product of Northeast Louisiana.

² For the purposes of this analysis, Northeast Louisiana includes the following parishes: Caldwell, East Carroll, Franklin, Jackson, Lincoln, Madison, Morehouse, Ouachita, Richland, Tensas, Union, and West Carroll.

this means that **one out of every 18 jobs** in Northeast Louisiana is supported by the activities of ULM and its students. These economic impacts break down as follows:

Operations spending impact

Payroll and benefits to support ULM's day-to-day operations amounted to \$87.7 million. The university's non-pay expenditures amounted to \$58.8 million.³

The net impact of operations spending by the university in Northeast Louisiana during the analysis year was approximately **\$108.2 million** in added income, which is equivalent to supporting **1,255 jobs**.

Research spending impact

Research activities of ULM impact the regional economy by employing people and making purchases for equipment, supplies, and services. They also facilitate new knowledge creation throughout Northeast Louisiana. In FY 2023-24, ULM spent \$802.0 thousand on payroll and \$500.0 thousand on other expenditures to support research activities (excluding indirect costs). Research spending of ULM generated **\$1.3 million** in added income for the Northeast Louisiana economy, which is equivalent to supporting **17 jobs**.

Spin-off company impact

ULM creates an exceptional environment that fosters innovation and entrepreneurship, evidenced by the number of spin-off companies related to ULM in the region. In FY 2023-24, spin-off companies related to ULM added **\$16.6 million** in income for the Northeast Louisiana economy, which is equivalent to supporting **381 jobs**.

Visitor spending impact

Out-of-region visitors attracted to Northeast Louisiana for activities at ULM brought new dollars to the economy through their spending at hotels, restaurants, gas stations, and other regional businesses. The spending from these visitors added approximately **\$1.8 million** in income for the Northeast Louisiana economy, which is equivalent to supporting **43 jobs**.

Student spending impact

About 48% of students attending ULM originated from outside the region. Some of these students relocated to Northeast Louisiana to attend the university. In addition, some students, referred to as retained students, are residents of Northeast Louisiana who would have left the region if not for the existence of ULM. The money that these students spent toward living expenses in Northeast Louisiana is attributable to ULM.

Important note

When reviewing the impacts estimated in this study, it is important to note that the study reports impacts in the form of added income rather than sales. Sales includes all of the intermediary costs associated with producing goods and services, as well as money that leaks out of the region as it is spent at out-of-region businesses. Income, on the other hand, is a net measure that excludes these intermediary costs and leakages and is synonymous with gross regional product (GRP) and value added. For this reason, it is a more meaningful measure of new economic activity than sales.

³ Research employees and their payroll, as well as non-pay research expenditures, are excluded from this impact as they are measured in the following impact.

The expenditures of relocated and retained students in the region during the analysis year added approximately **\$32.0 million** in income for the Northeast Louisiana economy, which is equivalent to supporting **652 jobs**.

Volunteerism impact

ULM encourages its students to volunteer in Northeast Louisiana, where they can work with businesses and organizations to help meet their goals. The work of these student volunteers allows businesses and organizations to grow, increasing their output and impacting the economy at large. ULM students volunteered more than 5,000 hours of their time in Northeast Louisiana in FY 2023-24. The work of ULM student volunteers is equivalent to **\$143.3 thousand** in earnings.

In terms of actual impact to the Northeast Louisiana economy, ULM student volunteers generated an impact of **\$104.6 thousand** in added income for the region in FY 2023-24, equivalent to supporting **five jobs**.

Alumni impact

Over the years, students gained new skills, making them more productive workers, by studying at ULM. Today, thousands of these former students are employed in Northeast Louisiana.

The accumulated impact of former students currently employed in the Northeast Louisiana workforce amounted to **\$457.7 million** in added income for the Northeast Louisiana economy, which is equivalent to supporting **8,111 jobs**.

Investment analysis

Investment analysis is the practice of comparing the costs and benefits of an investment to determine whether it is profitable. This study evaluates ULM as an investment from the perspectives of students, taxpayers, and society.

Student perspective

Students invest their own money and time in their education to pay for tuition, books, and supplies. Many take out student loans to attend the university, which they will pay back over time. While some students were employed while attending the university, students overall forewent earnings that they would have generated had they been in full employment instead of learning. Summing these direct outlays, opportunity costs, and future student loan costs yields a total of **\$91.3 million** in present value student costs.

In return, students will receive a present value of **\$486.3 million** in increased earnings over their working lives. This translates to a return of **\$5.30** in higher future earnings for every dollar that students invest in their education at ULM. The corresponding annual rate of return is **20.7%**.

Taxpayer perspective

Taxpayers provided **\$58.6 million** of state and local funding to ULM in FY 2023-24. In return, taxpayers will receive an estimated present value of **\$98.7 million** in added tax revenue stemming

For every tax dollar spent educating students attending ULM, taxpayers will receive an average of **\$2.40** in return over the course of the students' working lives.

from the students' higher lifetime earnings and the increased output of businesses. Savings to the public sector add another estimated **\$43.2 million** in benefits due to a reduced demand for government-funded social services in Louisiana. Total taxpayer benefits amount to **\$141.9 million**, the present value sum of the added tax revenue and public sector savings. For every tax dollar spent educating students attending ULM, taxpayers will receive an average of **\$2.40** in return over the course of the students' working lives. In other words, taxpayers receive an annual rate of return of **6.1%**.

Social perspective

People in Louisiana invested **\$214.2 million** in ULM in FY 2023-24. This includes the university's expenditures, student expenses, and student opportunity costs. In return, the state of Louisiana will receive an estimated present value of **\$1.2 billion** in added state revenue over the course of the students' working lives. Louisiana will also benefit from an estimated **\$212.5 million** in present value social savings related to reduced crime, lower welfare and unemployment assistance, and increased health and well-being across the state. For every dollar society invests in ULM, an average of **\$6.60** in benefits will accrue to Louisiana over the course of the students' careers.

Acknowledgments

Lightcast gratefully acknowledges the excellent support of the staff at the University of Louisiana Monroe in making this study possible. Special thanks go to the University of Louisiana System and the University of Louisiana Monroe, who approved the study; and to Melissa Rhodes, Assistant Director of Institutional Research, Institutional Effectiveness; and Luke Webb, Data Analyst, Institutional Effectiveness, who collected much of the data and information requested. Any errors in the report are the responsibility of Lightcast and not any of the above-mentioned individuals.

Chapter 1:

Introduction

THE UNIVERSITY OF LOUISIANA MONROE (ULM), established in 1931, has today grown to serve 9,623 students. The university's service region, for the purpose of this report, is referred to as Northeast Louisiana and consists of the following parishes: Caldwell, East Carroll, Franklin, Jackson, Lincoln, Madison, Morehouse, Ouachita, Richland, Tensas, Union, and West Carroll.

While this study only considers the economic benefits generated by ULM, it is worth noting the region receives a variety of benefits from the university, including social and cultural benefits that are difficult to quantify. The university naturally helps students achieve their individual potential and develop the knowledge, skills, and abilities they need to have fulfilling and prosperous careers. However, ULM impacts Northeast Louisiana beyond influencing the lives of students. The university's program offerings supply employers with workers to make their businesses more productive. The university, its day-to-day and construction operations, its research and entrepreneurial activities, the expenditures of its visitors and students, and its student volunteers support the regional economy through the output and employment generated by regional vendors. The benefits created by the university extend as far as the state treasury in terms of the increased tax receipts and decreased public sector costs generated by students across the state.

This report assesses the impact of ULM as a whole on the regional economy and the benefits generated by the university for students, taxpayers, and society. The approach is twofold. We begin with an economic impact analysis of the university on the Northeast Louisiana economy. To derive results, we rely on a specialized Multi-Regional Social Accounting Matrix (MR-SAM) model to calculate the added income created in the Northeast Louisiana economy as a result of increased consumer spending and the added knowledge, skills, and abilities of students. Results of the economic impact analysis are broken out according to the following impacts: 1) impact of the university's operations spending, 2) impact of the university's research spending, 3) impact of entrepreneurial activities, 4) impact of visitor spending, 5) impact of student spending, 6) impact of the university's student volunteers, and 7) impact of alumni who are still employed in the Northeast Louisiana workforce.

The second component of the study measures the benefits generated by ULM for the following stakeholder groups: students, taxpayers, and society. For students, we

ULM impacts Northeast Louisiana beyond influencing the lives of students.

perform an investment analysis to determine how the money spent by students on their education performs as an investment over time. The students' investment in this case consists of their out-of-pocket expenses, the cost of interest incurred on student loans, and the opportunity cost of attending the university as opposed to working. In return for these investments, students receive a lifetime of higher earnings. For taxpayers, the study measures the benefits to state taxpayers in the form of increased tax revenues and public sector savings stemming from a reduced demand for social services. Finally, for society, the study assesses how the students' higher earnings and improved quality of life create benefits throughout Louisiana as a whole.

The study uses a wide array of data that are based on several sources, including the FY 2023-24 academic and financial reports from ULM; industry and employment data from the Bureau of Labor Statistics and Census Bureau; outputs of Lightcast's impact model and MR-SAM model; and a variety of published materials relating education to social behavior.

Chapter 2:

Profile of the University of Louisiana Monroe and the economy

UNIVERSITY OF LOUISIANA MONROE (ULM) is a well-regarded and comprehensive public university providing a wide range of relevant and well-regarded programs to students in Monroe, Louisiana. As a member of the University of Louisiana System, ULM offers a variety of undergraduate and graduate courses and degree options. In FY 2023-24, ULM served over 9,500 students and is supported by a dedicated faculty and staff of over 1,000. Founded in 1931, ULM was originally known as Ouachita Parish Junior College. Since its establishment more than 90 years ago, ULM has grown to include four colleges and one graduate school.

ULM provides exceptional educational opportunities in a variety of formats, including online and in-person options. With more than 90 degree programs, ULM's flexible learning models make it easy for students to explore interests and gain skills. The university's diverse program offerings include Accounting, Computer Science, Dental Hygiene, Medical Laboratory Science, Nursing, Occupational Therapy, Toxicology, Social Work, and more. Further, ULM offers the only state-funded pharmacy program in Louisiana.

There are a multitude of opportunities for students to connect and engage on campus, including more than 100 student clubs and organizations. Small class sizes allow students to receive individual attention and access dedicated faculty. Further, students are invited to participate in campus-wide activities such as Week of Welcome and Homecoming Week, connect with volunteer opportunities, and engage in research.

In addition to providing excellent academic opportunities for students, ULM enhances the lives of community members through connection, engagement, and service. Local residents and visitors alike are encouraged to explore the Museum of Natural History, gaze exhibits at Bry Art Gallery, enjoy a show at the ULM Brown Theatre Complex, and cheer on the Warhawks at Malone Stadium and Fant-Ewing Coliseum.

ULM is also a vital asset to regional employers. Through key partnerships with industry and organizations, the university provides enrichment opportunities for the Northeast Louisiana community and supports economic development. A member of the Louisiana Small Business Development Center (LSBDC) network, the LSBDC at ULM provides management and technical assistance to entrepreneurs and small business owners. In addition, ULM's Center of Business Economic Research provides critical economic data supporting the sustainable development of Northeast Louisiana.

Through key partnerships with industry and organizations, the university provides enrichment opportunities for the Northeast Louisiana community and supports economic development.

ULM employee and finance data

The study uses two general types of information: 1) data collected from the university and 2) regional economic data obtained from various public sources and Lightcast’s proprietary data modeling tools.⁴ This chapter presents the basic underlying information from ULM used in this analysis and provides an overview of the Northeast Louisiana economy.

Employee data

Data provided by ULM include information on faculty and staff by place of work and by place of residence. These data appear in Table 2.1. As shown, ULM employed 872 full-time and 147 part-time faculty and staff in FY 2023-24 (including student workers). Of these, 97% worked in the region and 81% lived in the region. These data are used to isolate the portion of the employees’ payroll and household expenses that remains in the regional economy.

Revenues

Figure 2.1 shows the university’s annual revenues by funding source—a total of \$158.3 million in FY 2023-24. As indicated, tuition and fees comprised 29% of total revenue, and revenues from local, state, and federal government sources comprised another 47%. All other revenue (i.e., auxiliary revenue, sales and services, interest, and donations) comprised the remaining 23%. These data are critical in identifying the annual costs of educating the student body from the perspectives of students, taxpayers, and society.

Expenditures

Figure 2.2 displays ULM’s expense data. The combined payroll at ULM, including student salaries and wages, amounted to \$88.5 million. This was equal to 56% of the university’s total expenses for FY 2023-24. Other expenditures, including capital construction, operation and maintenance of plant, depreciation, and purchases of supplies and services, made up \$69.0 million. When we calculate the impact of these expenditures in Chapter 3, we exclude depreciation expenses, as they represent a devaluing of the university’s assets rather than an outflow of expenditures.

Table 2.1: Employee data, FY 2023-24

Full-time faculty and staff	872
Part-time faculty and staff	147
Total faculty and staff	1,019
% of employees who work in the region	97%
% of employees who live in the region	81%

Figure 2.2: ULM expenses by function, FY 2023-24

* Includes expenditures on capital projects in progress during the analysis year.

Source: Data provided by ULM

4 See Appendix 5 for a detailed description of the data sources used in the Lightcast modeling tools.

Students

ULM served 9,623 students in FY 2023-24. This number represents an unduplicated student headcount. The breakdown of the student body by gender was 65% female and 35% male. The breakdown by ethnicity was 57% white, 32% students of color, and 11% unknown. The students' overall average age was 24 years old.⁵ An estimated 51% of students remain in Northeast Louisiana after finishing their time at ULM, another 21% settle outside the region but in the state, and the remaining 28% settle outside the state.⁶

Table 2.2 summarizes the breakdown of the student population and their corresponding awards and credits by education level. In FY 2023-24, ULM served 73 professional degree graduates, 27 PhD graduates, 376 master's degree graduates, five post-baccalaureate certificate completers, 986 bachelor's degree graduates, and 31 associate degree graduates. Another 6,194 students enrolled in courses for credit but did not complete a degree during the reporting year. The university offered dual credit courses to high schools, serving a total of 1,931 students over the course of the year. We use credits to track the educational workload of the students. The average number of credits per student was 18.4.

Table 2.2: Breakdown of student headcount and credit production by education level, FY 2023-24

Category	Headcount	Total credits	Average credits
Professional degree graduates	73	3,264	44.7
PhD graduates	27	161	6.0
Master's degree graduates	376	4,652	12.4
Post-baccalaureate certificate completers	5	24	4.8
Bachelor's degree graduates	986	22,558	22.9
Associate degree graduates	31	286	9.2
Continuing students	6,194	131,785	21.3
Dual credit students	1,931	14,481	7.5
Total students	9,623	177,211	18.4

⁵ Unduplicated headcount, gender, ethnicity, and age data provided by ULM.
⁶ Lightcast used estimates based on ULM's recent Alumni Pathways matched data.

The Northeast Louisiana economy

ULM serves a region referred to as Northeast Louisiana.⁷ Since the university was first established, it has been serving Northeast Louisiana by enhancing the workforce, providing local residents with easy access to higher education opportunities, and preparing students for highly skilled, technical professions. Table 2.3 summarizes the breakdown of the regional economy by major industrial sector ordered by total income, with details on labor and non-labor income. Labor income refers to wages, salaries, and proprietors' income. Non-labor income refers to profits, rents, and other forms of investment income. Together, labor and non-labor income comprise the region's total income, which can also be considered the region's gross regional product (GRP).

Table 2.3: Income by major industry sector in Northeast Louisiana, 2023*

Industry sector	Labor income (millions)	Non-labor income (millions)	Total income (millions)**	% of total income	Sales (millions)
Manufacturing	\$822	\$960	\$1,782	13%	\$5,119
Health Care & Social Assistance	\$1,480	\$147	\$1,626	12%	\$2,562
Retail Trade	\$712	\$598	\$1,310	10%	\$2,181
Finance & Insurance	\$597	\$357	\$955	7%	\$1,486
Government, Non-Education	\$759	\$173	\$932	7%	\$4,512
Wholesale Trade	\$357	\$463	\$821	6%	\$1,359
Government, Education	\$712	\$0	\$712	5%	\$828
Construction	\$559	\$120	\$679	5%	\$1,309
Real Estate & Rental & Leasing	\$424	\$185	\$609	4%	\$1,329
Professional & Technical Services	\$445	\$87	\$532	4%	\$786
Administrative & Waste Services	\$420	\$55	\$475	3%	\$843
Transportation & Warehousing	\$268	\$203	\$472	3%	\$848
Agriculture, Forestry, Fishing & Hunting	\$272	\$189	\$461	3%	\$981
Other Services (except Public Administration)	\$387	\$52	\$439	3%	\$763
Information	\$170	\$263	\$433	3%	\$762
Accommodation & Food Services	\$287	\$145	\$432	3%	\$877
Mining, Quarrying, & Oil and Gas Extraction	\$87	\$309	\$396	3%	\$743
Utilities	\$84	\$238	\$322	2%	\$505
Management of Companies & Enterprises	\$179	\$12	\$191	1%	\$299
Educational Services	\$91	\$4	\$95	1%	\$119
Arts, Entertainment, & Recreation	\$45	\$21	\$66	<1%	\$121
Total	\$9,158	\$4,581	\$13,738	100%	\$28,331

* Data reflect the most recent year for which data are available. Lightcast data are updated quarterly.

** Numbers may not sum to totals due to rounding.

Source: Lightcast industry data

7 The following parishes comprise Northeast Louisiana: Caldwell, East Carroll, Franklin, Jackson, Lincoln, Madison, Morehouse, Ouachita, Richland, Tensas, Union, and West Carroll.

As shown in Table 2.3, the total income, or GRP, of Northeast Louisiana is approximately \$13.7 billion, equal to the sum of labor income (\$9.2 billion) and non-labor income (\$4.6 billion). In Chapter 3, we use the total added income as the measure of the relative impacts of the university on the regional economy.

Figure 2.3 provides the breakdown of jobs by industry in Northeast Louisiana. The Health Care & Social Assistance sector is the largest employer, supporting 29,069 jobs or 15.2% of total employment in the region. The second largest employer is the Retail Trade sector, supporting 21,000 jobs or 11.0% of the region's total employment. Altogether, the region supports 191,201 jobs.⁸

Figure 2.3: Jobs by major industry sector in Northeast Louisiana, 2023*

* Data reflect the most recent year for which data are available. Lightcast data are updated quarterly.
Source: Lightcast employment data

Table 2.4 and Figure 2.4 present the mean earnings by education level in Northeast Louisiana and the state of Louisiana at the midpoint of the average-aged worker's career. These numbers are derived from Lightcast's complete employment data on average earnings per worker in the region and the state.⁹ The numbers are then weighted by the university's demographic profile, and state earnings are weighted

8 Job numbers reflect Lightcast's complete employment data, which includes the following four job classes: 1) employees who are counted in the Bureau of Labor Statistics' Quarterly Census of Employment and Wages (QCEW), 2) employees who are not covered by the federal or state unemployment insurance (UI) system and are thus excluded from QCEW, 3) self-employed workers, and 4) extended proprietors.

9 Wage rates in the Lightcast MR-SAM model combine state and federal sources to provide earnings that reflect complete employment in the state, including proprietors, self-employed workers, and others not typically included in regional or state data, as well as benefits and all forms of employer contributions. As such, Lightcast industry earnings-per-worker numbers are generally higher than those reported by other sources.

Expanding access to dental care: ULM's second Mobile Dental Hygiene Unit moves forward

With the support of U.S. Senator John Kennedy, a second Mobile Dental Hygiene Unit (MDHU) is progressing through the appropriations process. This initiative aims to expand dental services to several parishes surrounding ULM, many of which are designated as Primary Medical Health Professional Shortage Areas or Medically Underserved Areas. These rural regions face significant healthcare barriers, including cost, transportation, and limited provider access. The MDHU is a proven model for delivering high-quality, efficient care to hard-to-reach communities while providing invaluable hands-on training for dental hygiene students.

For over 15 years, ULM's existing MDHU has served the Louisiana Delta and beyond, offering critical dental care to patients who lack financial resources or transportation. This initiative has not only addressed pressing healthcare disparities but has also provided essential clinical experience for students in the dental hygiene program.

Since its inception, the MDHU has treated thousands of children and adults across Ouachita, Morehouse, Jackson, Richland, Lincoln, Caldwell, East Carroll, and West Carroll parishes. During AY 2023, the unit served 276 patients,

while more than 300 dental hygiene students gained hands-on experience.

Given its success, the MDHU has received numerous requests from school-based clinics and agencies in additional parishes, highlighting the urgent need for expansion. With Senator Kennedy's support, the new MDHU is nearing approval, enabling ULM to extend its reach, serve more patients in economically disadvantaged areas, and enhance student learning opportunities.

by students' settlement patterns. As shown, students have the potential to earn more as they achieve higher levels of education compared to maintaining a high school diploma. Students who earn a bachelor's degree from ULM can expect approximate wages of \$46,800 per year within Northeast Louisiana, approximately \$18,500 more than someone with a high school diploma.

Table 2.4: Average earnings by education level at a ULM student's career midpoint

Education level	Regional earnings	Difference from next lowest degree	State earnings	Difference from next lowest degree
High school or equivalent	\$28,300	n/a	\$30,400	n/a
Associate degree	\$37,900	\$9,600	\$40,800	\$10,400
Bachelor's degree	\$46,800	\$8,900	\$50,400	\$9,600
Master's degree	\$54,400	\$7,600	\$58,600	\$8,200
Doctoral degree	\$76,600	\$22,200	\$82,500	\$23,900

Economic impacts on the Northeast Louisiana economy

ULM impacts the Northeast Louisiana economy in a variety of ways. The university is an employer and buyer of goods and services. It attracts monies that otherwise would not have entered the regional economy through its day-to-day and construction operations, its research and entrepreneurial activities, and the expenditures of its visitors and students. ULM also encourages its students to volunteer in Northeast Louisiana, where they can work with businesses and organizations to help meet their goals. Further, it provides students with the knowledge, skills, and abilities they need to become productive citizens and add to the overall output of the region.

IN THIS CHAPTER, we estimate the following economic impacts of ULM: 1) operations spending impact, 2) research spending impact, 3) spin-off company impact, 4) visitor spending impact, 5) student spending impact, 6) volunteerism impact, and 7) alumni impact, measuring the income added in the region as former students expand the regional economy's stock of human capital.

When exploring each of these economic impacts, we consider the following hypothetical question:

How would economic activity change in Northeast Louisiana if ULM and all its alumni did not exist in FY 2023-24?

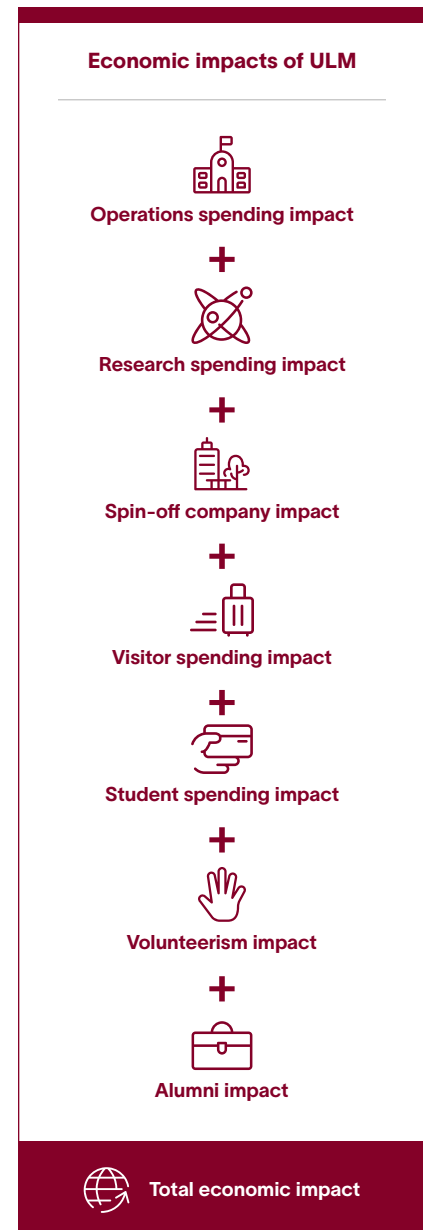

Each of the economic impacts should be interpreted according to this hypothetical question. Another way to think about the question is to realize that we measure net impacts, not gross impacts. Gross impacts represent an upper-bound estimate in terms of capturing all activity stemming from the university; however, net impacts reflect a truer measure of economic impact since they demonstrate what would not have existed in the regional economy if not for the university.

Economic impact analyses use different types of impacts to estimate the results. The impact focused on in this study assesses the change in income. This measure is similar to the commonly used gross regional product (GRP). Income may be further broken out into the **labor income impact**, also known as earnings, which assesses the change in employee compensation; and the **non-labor income impact**, which assesses the change in business profits. Together, labor income and non-labor income sum to total income.

Another way to state the impact is in terms of **jobs**, a measure of the number of full- and part-time jobs that would be required to support the change in income. Finally, a frequently used measure is the **sales impact**, which comprises the change in business sales revenue in the economy as a result of increased economic activity. It is important to bear in mind, however, that much of this sales revenue leaves the regional economy through intermediary transactions and costs.¹⁰ All of these measures—added labor and non-labor income, total income, jobs, and sales—are used to estimate the economic impact results presented in this chapter. The analysis breaks out the impact measures into different components, each based on the economic effect that caused the impact. The following is a list of each type of effect presented in this analysis:

- The **initial effect** is the exogenous shock to the economy caused by the initial spending of money, whether to pay for salaries and wages, purchase goods or services, or cover operating expenses. This effect is only represented by labor income and sales and has zero non-labor income, as the initial effect of the university spending stems exclusively from its employees' salaries, wages, and benefits, while any other direct expenditures of the university are reflected in the sales amount.

¹⁰ See Appendix 4 for an example of the intermediary costs included in the sales impact but not in the income impact.

- The initial round of spending creates more spending in the economy, resulting in what is commonly known as the **multiplier effect**. The multiplier effect comprises the additional activity that occurs across all industries in the economy and may be further decomposed into the following three types of effects:
 - The **direct effect** refers to the additional economic activity that occurs as the industries affected by the initial effect spend money to purchase goods and services from their supply chain industries.
 - The **indirect effect** occurs as the supply chain of the initial industries creates even more activity in the economy through inter-industry spending.
 - The **induced effect** refers to the economic activity created by the household sector as the businesses affected by the initial, direct, and indirect effects raise salaries or hire more people.

The terminology used to describe the economic effects listed above differs slightly from that of other commonly used input-output models, such as IMPLAN. For example, the initial effect in this study is called the “direct effect” by IMPLAN, as shown below. Further, the term “indirect effect” as used by IMPLAN refers to the combined direct and indirect effects defined in this study. To avoid confusion, readers are encouraged to interpret the results presented in this chapter in the context of the terms and definitions listed above. Note that, regardless of the effects used to decompose the results, the total impact measures are analogous.

Lightcast	Initial	Direct	Indirect	Induced
IMPLAN	Direct	Indirect		Induced

Multiplier effects in this analysis are derived using Lightcast’s Multi-Regional Social Accounting Matrix (MR-SAM) input-output model that captures the interconnection of industries, government, and households in the region. The Lightcast MR-SAM contains approximately 1,000 industry sectors at the highest level of detail available in the North American Industry Classification System (NAICS) and supplies the industry-specific multipliers required to determine the impacts associated with increased activity within a given economy. The multi-regional capacity of the MR-SAM allows impacts to be measured in the region and state simultaneously, accounting for ULM’s activity in each area, as well as each area’s economic characteristics. In this analysis, impacts on the region include impacts from the university’s regional activity, as well as the indirect and induced multiplier effects that reach the region from the university’s activity in the rest of the state. For more information on the Lightcast MR-SAM model and its data sources, see Appendix 5.

Net impacts reflect a truer measure of economic impact since they demonstrate what would not have existed in the regional economy if not for the university.

Operations spending impact

Faculty and staff payroll is part of the region's total earnings, and the spending of employees for groceries, apparel, and other household expenditures helps support regional businesses. The university itself purchases supplies and services, and many of its vendors are located in Northeast Louisiana. These expenditures create a ripple effect that generates still more jobs and higher wages throughout the economy.

Table 3.1 presents university expenditures (excluding research) for the following three categories: 1) salaries, wages, and benefits, 2) operation and maintenance of plant,¹¹ and 3) all other expenditures, including purchases for supplies and services. Also included in all other expenditures are expenses associated with grants and scholarships. Many students receive grants and scholarships that exceed the cost of tuition and fees. The university then dispenses this residual financial aid to students, who spend it on living expenses. Some of this spending takes place in the region, and is therefore an injection of new money into the regional economy that would not have happened if ULM did not exist. In this analysis, we exclude depreciation expenses due to the way this measure is calculated in the national input-output accounts, and because depreciation represents the devaluing of the university's assets rather than an outflow of expenditures.¹²

Table 3.1: ULM expenses by function (excluding depreciation), FY 2023-24

Expense category	In-region expenditures (thousands)	Out-of-region expenditures (thousands)	Total expenditures (thousands)
Employee salaries, wages, and benefits	\$85,026	\$2,630	\$87,656
Operation and maintenance of plant	\$8,337	\$5,985	\$14,322
All other expenditures	\$7,310	\$37,150	\$44,460
Total	\$100,674	\$45,764	\$146,438

This table does not include expenditures on research, as they are presented separately in the following section.

Source: Data provided by ULM and the Lightcast impact model

The first step in estimating the multiplier effects of the university's operational expenditures is to map these categories of expenditures to the approximately 1,000 industries of the Lightcast MR-SAM model. Assuming that the spending patterns of university personnel approximately match those of the average U.S. consumer, we map salaries, wages, and benefits to spending on industry outputs using national household

¹¹ Capital construction expenses are included under operation and maintenance of plant.

¹² This aligns with the economic impact guidelines set by the Association of Public and Land-Grant Universities. Ultimately, excluding these measures results in more conservative and defensible estimates.

expenditure coefficients provided by Lightcast’s national SAM. Approximately 97% of ULM employees work in Northeast Louisiana (see Table 2.1), and therefore we consider 97% of the salaries, wages, and benefits. For the other two expenditure categories (i.e., operation and maintenance of plant and all other expenditures), we assume the university’s spending patterns approximately match national averages and apply the national spending coefficients for NAICS 902612 (Colleges, Universities, and Professional Schools (State Government)).¹³ Operation and maintenance of plant expenditures are mapped to the industries that relate to capital construction, maintenance, and support, while the university’s remaining expenditures are mapped to the remaining industries.

We now have three vectors of expenditures for ULM: one for salaries, wages, and benefits; another for operation and maintenance of plant; and a third for the university’s purchases of supplies and services. The next step is to estimate the portion of these expenditures that occurs inside the region. The expenditures occurring outside the region are known as leakages. We estimate in-region expenditures using regional purchase coefficients (RPCs), a measure of the overall demand for the commodities produced by each sector that is satisfied by regional suppliers, for each of the approximately 1,000 industries in the MR-SAM model.¹⁴ For example, if 40% of the demand for NAICS 541211 (Offices of Certified Public Accountants) is satisfied by regional suppliers, the RPC for that industry is 40%. The remaining 60% of the demand for NAICS 541211 is provided by suppliers located outside the region. The three vectors of expenditures are multiplied, industry by industry, by the corresponding RPC to arrive at the in-region expenditures associated with the university. See Table 3.1 for a break-out of the expenditures that occur in-region. Finally, in-region spending is entered, industry by industry, into the MR-SAM model’s multiplier matrix, which in turn provides an estimate of the associated multiplier effects on regional labor income, non-labor income, total income, sales, and jobs.

Table 3.2 presents the economic impact of university operations spending. The people employed by ULM and their salaries, wages, and benefits comprise the initial effect, shown in the top row of the table in terms of labor income, non-labor income, total added income, sales, and jobs. The additional impacts created by the initial effect appear in the next four rows under the section labeled *multiplier effect*. Summing the initial and multiplier effects, the gross impacts are \$106.5 million in labor income and \$17.0 million in non-labor income. This sums to a total impact of \$123.5 million in total added income associated with the spending of the university and its employees in the region. This is equivalent to supporting 1,456 jobs.

The \$123.5 million in gross impact is often reported by researchers as the total impact. We go a step further to arrive at a net impact by applying a counterfactual scenario, i.e., what would have happened if a given event—in this case, the expenditure of in-region funds on ULM—had not occurred. ULM received an estimated 28% of its funding from sources within Northeast Louisiana. This portion of the university’s funding came from the tuition and fees paid by resident students, from the auxiliary revenue and donations

13 See Appendix 2 for a definition of NAICS.

14 See Appendix 5 for a description of Lightcast’s MR-SAM model.

from private sources located within the region, from state and local taxes, and from the financial aid issued to students by state and local government. We must account for the opportunity cost of this in-region funding. Had other industries received these monies rather than ULM, income impacts would have still been created in the economy. In economic analysis, impacts that occur under counterfactual conditions are used to offset the impacts that actually occur in order to derive the true impact of the event under analysis.

We estimate this counterfactual by simulating a scenario where in-region monies spent on the university are instead spent on consumer goods and savings. This simulates the in-region monies being returned to the taxpayers and being spent by the household sector. Our approach is to establish the total amount spent by in-region students and taxpayers on ULM, map this to the detailed industries of the MR-SAM model using national household expenditure coefficients, use the industry RPCs to estimate in-region spending, and run the in-region spending through the MR-SAM model's multiplier matrix to derive multiplier effects. The results of this exercise are shown as negative values in the row labeled *less alternative uses of funds* in Table 3.2.

The total net impact of the university's operations is equal to the gross impact less the impact of the alternative use of funds—the opportunity cost of the regional money. As shown in the last row of Table 3.2, the total net impact is approximately \$98.5 million in labor income and \$9.7 million in non-labor income. This sums together to \$108.2 million in total added income and is equivalent to supporting 1,255 jobs. These impacts represent new economic activity created in the regional economy solely attributable to the operations of ULM.

The total net impact of the university's operations is **\$108.2 million** in total added income, which is equivalent to supporting **1,255 jobs**.

Table 3.2: Operations spending impact, FY 2023-24

	Labor income (thousands)	Non-labor income (thousands)	Total income (thousands)	Sales (thousands)	Jobs supported
Initial effect	\$85,026	\$0	\$85,026	\$146,438	980
Multiplier effect					
Direct effect	\$5,691	\$3,322	\$9,013	\$15,647	101
Indirect effect	\$1,135	\$555	\$1,690	\$3,034	20
Induced effect	\$14,639	\$13,104	\$27,743	\$44,739	356
Total multiplier effect	\$21,465	\$16,982	\$38,446	\$63,420	477
Gross impact (initial + multiplier)	\$106,491	\$16,982	\$123,473	\$209,858	1,456
Less alternative uses of funds	-\$7,984	-\$7,320	-\$15,304	-\$35,965	-201
Net impact	\$98,507	\$9,662	\$108,169	\$173,893	1,255

Source: Lightcast impact model

Research spending impact

Similar to the day-to-day operations of ULM, research activities impact the economy by employing people and requiring the purchase of equipment and other supplies and services. Figure 3.1 shows ULM’s research expenses by function—payroll, equipment, and pass-throughs (excluding indirect costs¹⁵)—for the last four fiscal years. In FY 2023-24, ULM spent \$1.3 million on research and development activities. These expenses would not have been possible without funding from outside the region—ULM received around 13% of its research funding from federal sources.

We employ a methodology similar to the one used to estimate the impacts of operational expenses. We begin by mapping total research expenses to the industries of the MR-SAM model, removing the spending that occurs outside the region, and then running the in-region expenses through the multiplier matrix. As with the operations spending impact, we also adjust the gross impacts to account for the opportunity cost of monies withdrawn from the regional economy to support the research of ULM, whether through state-sponsored research awards or through private donations. Again, we refer to this adjustment as the alternative use of funds.

Mapping the research expenses by category to the industries of the MR-SAM model—the only difference from our previous methodology—requires some exposition. We asked ULM to provide information on expenditures by research and development field as they report to the National Science Foundation’s Higher Education Research and Development Survey (HERD).¹⁶ We map these fields of study to their respective industries in the MR-SAM model. The result is a distribution of research expenses to the various 1,000 industries that follows a weighted average of the fields of study reported by ULM.

Initial, direct, indirect, and induced effects of ULM’s research expenses appear in Table 3.3. As with the operations spending impact, the initial effect consists of the nine research jobs and their associated salaries, wages, and benefits. The university’s research expenses have a total gross impact of \$1.2 million in labor income and \$162.3 thousand in non-labor income. This sums together to \$1.3 million in added income, equivalent to 17 jobs. Taking into account the impact of the alternative uses of funds, net research expenditure impacts of ULM are \$1.1 million in labor income and \$138.2 thousand in non-labor income. This sums together to \$1.3 million in total added income and is equivalent to supporting 17 jobs.

15 Because indirect costs are not necessarily spent during the analysis year, they are excluded from this analysis. Ultimately, excluding these measures results in more conservative and defensible estimates.

16 The fields include environmental sciences, life sciences, physical sciences, social sciences, and all non-science and engineering fields.

Source: Lightcast impact model

ULM's research activities create an economic impact beyond spending. There are impacts created through the entrepreneurial and innovative activities stemming from ULM's research. Research activities, along with, general added productivity all have immense value in the regional economy. However, the full magnitude of their value is difficult to quantify. Some of this value may be captured in the entrepreneurial and alumni impacts, presented later in this chapter. The broader spill-over effects, however, remain as additional value created beyond the scope of this analysis.

ULM and U.S. Army ERDC partner to expand Louisiana state mesonet network

With the support of U.S. Congresswoman Julia Letlow (LA-05), this groundbreaking statewide initiative—the first of its kind in Louisiana—officially launched in FY 2023. Data collected from mesonets has the potential to save businesses and taxpayers millions of dollars annually by directly impacting industries such as agriculture, aviation, education and research, homeland security, transportation, and energy. Additionally, mesonet data plays a crucial role in enhancing the state's disaster preparedness efforts.

ULM's recent partnership with the U.S. Army Engineer Research and Development Center (ERDC) has significantly expanded the project's scope. As part of this collaboration, ULM will work with ERDC to provide environmental

modeling and weather planning support for mission operations. A key focus of this partnership is the development of the Louisiana State Mesonet Network, which will deliver mission-critical data and research to improve understanding of soil conditions, flood planning, and wildfire risk management. These insights will ultimately enhance real-time modeling capabilities, leading to faster response times and more informed decision-making.

To mark the first installation of the Louisiana State Mesonet, ULM hosted a ribbon-cutting ceremony at the mesonet site adjacent to University Park on Bon Aire Drive. Special guest speakers included U.S. Representative Julia Letlow, whose leadership was instrumental in securing funding for the project; and

Brad Bryant, Meteorologist-in-Charge for the National Weather Service in Shreveport.

The Louisiana State Mesonet currently has four fully operational sites, with a goal of reaching 15 by the end of 2024. Once complete, the network will consist of 50 weather stations strategically placed in data-sparse regions across Louisiana. These stations will monitor key environmental factors such as temperature, humidity, atmospheric pressure, solar radiation, wind speed and direction, precipitation, and soil conditions. The mesonet's data will be vital for weather and climate monitoring, benefiting critical sectors including severe weather forecasting, homeland security and emergency management, aviation, energy and renewables, agriculture, transportation, and education.

Spin-off company impact

ULM creates an exceptional environment that fosters innovation and entrepreneurship, evidenced by the number of ULM spin-off companies. These companies, established through ULM's programs supporting entrepreneurial business development, or created by faculty, students, or alumni due to their experience at ULM, contribute to the region. This subsection presents the economic impact of companies that would not have existed in the region but for the presence of ULM.

We vary our methodology from the previous sections in order to estimate the impacts of spin-off companies. Ideally, we would use detailed financial information for all spin-off companies to estimate their impacts. However, collecting that information is not feasible and would raise a number of privacy concerns. As an alternative, we use the number of employees of each spin-off company that was collected and reported by the university. We consider a total of 51 spin-off companies, employing 240 people related to ULM that were active in Northeast Louisiana during the analysis year.

First, we match each spin-off company to the closest NAICS industry. Next, we assume the companies have earnings and spending patterns—or production functions—similar to their respective industry averages. Given the number of employees reported for each company, we use industry-specific jobs-to-earnings and earnings-to-sales ratios to estimate the sales of each business. Once we have the sales estimates, we follow a similar methodology as outlined in the previous sections by running sales through the MR-SAM to generate the direct, indirect, and induced multiplier effects.

ULM creates an exceptional environment that fosters innovation and entrepreneurship, evidenced by the number of ULM spin-off companies that have been created in the region.

The link between the university and the existence of its spin-off companies is less direct and is thus viewed as more subjective. We include the impacts from spin-off companies in the grand total impact presented later in the report since they represent entrepreneurial activities of the university. But we have included them separately here in case the reader would like to exclude the impacts from spin-off companies from the grand total impact.¹⁷

As demonstrated in Table 3.4, the university creates an exceptional environment that fosters innovation and entrepreneurship. As a result, the impact of spin-off companies related to ULM is \$11.2 million in added labor income and \$5.4 million in non-labor income, totaling \$16.6 million in added income—the equivalent of supporting 381 jobs.

Table 3.4: Impact of spin-off companies related to ULM, FY 2023-24

	Labor income (thousands)	Non-labor income (thousands)	Total income (thousands)	Sales (thousands)	Jobs supported
Initial effect	\$7,051	\$3,380	\$10,431	\$17,872	240
Multiplier effect					
Direct effect	\$1,247	\$623	\$1,870	\$3,309	44
Indirect effect	\$350	\$171	\$521	\$929	12
Induced effect	\$2,517	\$1,271	\$3,788	\$6,379	85
Total multiplier effect	\$4,114	\$2,064	\$6,178	\$10,617	141
Total impact (initial + multiplier)	\$11,165	\$5,444	\$16,609	\$28,489	381

Source: Lightcast impact model

¹⁷ The readers are ultimately responsible for making their own judgment on the veracity of the linkages between spin-off companies and ULM. At the very least, the impacts of the spin-off businesses provide important context for the broader effects of ULM.

Visitor spending impact

Thousands of out-of-region visitors came to ULM in FY 2023-24 to participate in various activities, including commencement, sports events, and orientation. ULM estimated that 15,075 out-of-region visitors attended events it hosted in FY 2023-24. Table 3.5 presents the average expenditures per person-trip for accommodation, food, transportation, and other personal expenses (including shopping and entertainment). Based on these figures, the gross spending of out-of-region visitors totaled \$5.5 million in FY 2023-24. However, some of this spending includes monies paid to the university

Table 3.5: Average per-trip visitor costs and sales generated by out-of-region visitors in Northeast Louisiana, FY 2023-24*

Accommodation	\$51
Food	\$126
Entertainment and shopping	\$107
Transportation	\$79
Total expenses per visitor	\$364
<i>Number of out-of-region visitors</i>	<i>15,075</i>
Gross sales	\$5,483,248
On-campus sales (excluding textbooks)	-\$1,120,840
Net off-campus sales	\$4,362,407

* Costs have been adjusted to account for the length of stay of out-of-region visitors, which was an average of one night. Accommodation and transportation have been adjusted downward to recognize that, on average, two visitors share these costs. Numbers may not sum to total due to rounding.

Source: Sales calculations estimated by Lightcast based on data provided by ULM

Thousands of out-of-region visitors came to ULM in FY 2023-24 to participate in various activities, including commencement, sports events, and orientation.

through non-textbook items (e.g., event tickets, food, etc.). These have already been accounted for in the operations spending impact and should thus be removed to avoid double-counting. We estimate that on-campus sales generated by out-of-region visitors totaled \$1.1 million. The net sales from out-of-region visitors in FY 2023-24 thus come to \$4.4 million.

Calculating the increase in income as a result of visitor spending again requires use of the MR-SAM model. The analysis begins by discounting the off-campus sales generated by out-of-region visitors to account for leakage in the trade sector, and then bridging the net figures to the detailed sectors of the MR-SAM model. The model runs the net sales figures through the multiplier matrix to arrive at the multiplier effects. As shown in Table 3.6, the net impact of visitor spending in FY 2023-24 is \$1.0 million in labor income and \$745.3 thousand in non-labor income. This totals to \$1.8 million in added income and is equivalent to supporting 43 jobs.

Table 3.6: Visitor spending impact, FY 2023-24

	Labor income (thousands)	Non-labor income (thousands)	Total income (thousands)	Sales (thousands)	Jobs supported
Initial effect	\$0	\$0	\$0	\$4,362	0
Multiplier effect

Indirect effect	\$167	\$119	\$286	\$555	7
Induced effect	\$220	\$167	\$387	\$713	9
Total multiplier effect	\$1,011	\$745	\$1,756	\$3,310	43
Total impact (initial + multiplier)	\$1,011	\$745	\$1,756	\$7,672	43

Source: Lightcast impact model

Student spending impact

Both in-region and out-of-region students contribute to the student spending impact of ULM. However, not all of these students can be counted toward the impact. Of the in-region students, only the impact from those students who were retained, or who would have left the region to seek education elsewhere had they not attended ULM, is measured. Students who would have stayed in the region anyway are not counted toward the impact since their monies would have been added to the Northeast Louisiana economy regardless of ULM. In addition, only the out-of-region students who relocated to Northeast Louisiana to attend the university are considered. Students who commute from outside the region or take courses online are not counted towards the student spending impact because they are not adding money from living expenses to the region.

While there were 3,105 students attending ULM who originated from Northeast Louisiana (excluding dual credit high school students), not all of them would have remained in the region if not for the existence of ULM. We apply a conservative assumption that 10% of these students would have left Northeast Louisiana for other education opportunities if ULM did not exist.¹⁸ Therefore, we recognize that the in-region spending of 311 students retained in the region is attributable to ULM. These students, called retained students, spent money at businesses in the region for everyday needs such as groceries, accommodation, and transportation. Of the retained students, we estimate 43 lived on campus while attending the university. While these students spend money while attending the university, we exclude most

The total impact of student spending is **\$32.0 million** in total added income and is equivalent to supporting **652 jobs**.

¹⁸ See Appendix 1 for a sensitivity analysis of the retained student variable.

of their spending for room and board since these expenditures are already reflected in the impact of the university's operations.

Relocated students are also accounted for in ULM's student spending impact. An estimated 2,582 students came from outside the region and lived off campus while attending ULM in FY 2023-24. Another estimated 1,393 out-of-region students lived on campus while attending the university. We apply the same adjustment as described above to the students who relocated and lived on campus during their time at the university. Collectively, the off-campus expenditures of out-of-region students supported jobs and created new income in the regional economy.¹⁹

The average costs for students appear in the first section of Table 3.7, equal to \$17,313 per student. Note that this table excludes expenses for books and supplies, since many of these costs are already reflected in the operations spending impact discussed in the previous section. We multiply the \$17,313 in annual costs by the 2,850 students who either were retained or relocated to the region because of ULM and lived in-region but off campus. This provides us with an estimate of their total spending. For students living on campus, we multiply the per-student cost of off-campus food purchases (assumed to be equal to 25% of room and board), personal expenses, and transportation by the number of students who lived in the region but on campus while attending (1,436 students). Altogether, off-campus spending of relocated and retained students generated gross sales of \$62.0 million. This figure, once net of the monies paid to student workers, yields net off-campus sales of \$61.2 million, as shown in the bottom row of Table 3.7.

Table 3.7: Average student costs and total sales generated by relocated and retained students in Northeast Louisiana, FY 2023-24

Room and board	\$11,337
Personal expenses	\$3,811
Transportation	\$2,165
Total expenses per student	\$17,313
<i>Number of students retained</i>	<i>311</i>
<i>Number of students relocated</i>	<i>3,975</i>
Gross retained student sales	\$5,006,338
Gross relocated student sales	\$56,979,764
Total gross off-campus sales	\$61,986,102
Wages and salaries paid to student workers*	\$770,978
Net off-campus sales	\$61,215,125

* This figure reflects only the portion of payroll that was used to cover the living expenses of relocated and retained student workers who lived in the region.

Source: Student costs and wages provided by ULM. The number of relocated and retained students who lived in the region off campus or on campus while attending is derived by Lightcast from the student origin data and in-term residence data provided by ULM.

19 Online students and students who commuted to Northeast Louisiana from outside the region are not considered in this calculation because it is assumed their living expenses predominantly occurred in the region where they resided during the analysis year. We recognize that not all online students live outside the region, but keep the assumption given data limitations.

Estimating the impacts generated by the \$61.2 million in student spending follows a procedure similar to that of the operations spending impact described above. We distribute the \$61.2 million in sales to the industry sectors of the MR-SAM model, apply RPCs to reflect in-region spending, and run the net sales figures through the MR-SAM model to derive multiplier effects.

Table 3.8 presents the results. The initial effect is purely sales-oriented and there is no change in labor or non-labor income. The impact of relocated and retained student spending thus falls entirely under the multiplier effect. The total impact of student spending is \$19.3 million in labor income and \$12.7 million in non-labor income. This sums together to \$32.0 million in total added income and is equivalent to supporting 652 jobs. These values represent the direct effects created at the businesses patronized by the students, the indirect effects created by the supply chain of those businesses, and the effects of the increased spending of the household sector throughout the regional economy as a result of the direct and indirect effects.

Table 3.8: Student spending impact, FY 2023-24

	Labor income (thousands)	Non-labor income (thousands)	Total income (thousands)	Sales (thousands)	Jobs supported
Initial effect	\$0	\$0	\$0	\$61,215	0
Multiplier effect					
Direct effect	\$12,170	\$7,929	\$20,099	\$36,525	409
Indirect effect	\$2,955	\$1,927	\$4,882	\$9,239	109
Induced effect	\$4,154	\$2,863	\$7,017	\$12,463	134
Total multiplier effect	\$19,279	\$12,718	\$31,997	\$58,227	652
Total impact (initial + multiplier)	\$19,279	\$12,718	\$31,997	\$119,443	652

Source: Lightcast impact model

Volunteerism impact

Beyond positively impacting the region through the activities occurring at ULM, such as music concerts and festivals, ULM directly impacts the regional economy through its facilitation and support of student volunteer activities. Volunteers are an important part of society because they positively impact those less fortunate. Many non-profit organizations would not exist without the support of their volunteers. Volunteerism is often seen as an altruistic act, but it can also provide personal benefits, such as decreasing the risk of depression, promoting an active mind and body, reducing stress, meeting new friends, and creating a feeling of self-fulfillment and belonging.

ULM students volunteered over 5,000 hours of their time supporting non-profit organizations and causes across Northeast Louisiana in FY 2023-24. According to Independent Sector,²⁰ the only national membership organization that brings together the charitable community, the average value of a volunteer hour in Louisiana is \$28.52. Multiplying this by the hours ULM students volunteered amounts to \$143.3 thousand in value to the community.

Next, we convert the \$143.3 thousand in value or, for the purposes of economic impact modeling, earnings by industry to sales using the MR-SAM model's earnings-to-sales ratios, and run the sales figures through the MR-SAM model to derive multiplier effects. Unlike other components of this analysis, we do not include the initial effect. This is because volunteers are not paid employees of the businesses and organizations, so

ULM student volunteer hours are valued at **\$143.3 thousand**.

²⁰ By state value per volunteer hour was provided by Independent Sector (see https://independentsector.org/resource/vovt_details/).

there is no initial labor income associated with their increased productivity or increased initial non-labor income associated with the business output. Therefore, we only include the multiplier effects from the volunteers in the total impact. ULM volunteers' productivity allows leaders of the businesses and organizations to devote resources to other projects, generating effects throughout the economy—the multiplier effects. Table 3.9 outlines this process. In FY 2023-24, ULM volunteers added \$97.7 thousand in labor income and \$6.9 thousand in non-labor income. The total added income from ULM volunteers to the Northeast Louisiana economy sums to \$104.6 thousand in FY 2023-24. This \$104.6 thousand is equivalent to supporting five jobs in the region.

Table 3.9: Volunteerism impact, FY 2023-24

Alumni impact

In this section, we estimate the economic impacts stemming from the added labor income of alumni in combination with their employers' added non-labor income. This impact is based on the number of students who have attended ULM *throughout its history*. We then use this total number to consider the impact of those students in the single FY 2023-24. Former students who earned a degree as well as those who may not have finished their degree or did not take courses in pursuit of achieving a degree are considered alumni.

While ULM creates an economic impact through its operations, research, entrepreneurial, visitor, and student spending, as well as volunteerism, the greatest economic impact of ULM stems from the added human capital—the knowledge, creativity, imagination, and entrepreneurship—found in its alumni. While attending ULM, students gain experience, education, and the knowledge, skills, and abilities that increase their productivity and allow them to command a higher wage once they enter the workforce. But the reward of increased productivity does not stop there. Talented professionals make capital more productive too (e.g., buildings, production facilities, equipment). The employers of ULM alumni enjoy the fruits of this increased productivity in the form of additional non-labor income (i.e., higher profits).

The methodology here differs from the previous impacts in one fundamental way. Whereas the previous spending impacts depend on an annually renewed injection of new sales into the regional economy, the alumni impact is the result of years of past instruction and the associated accumulation of human capital. The initial effect of

The greatest economic impact of ULM stems from the added human capital—the knowledge, creativity, imagination, and entrepreneurship—found in its alumni.

alumni is made up of two main components. The first and largest of these is the added labor income of ULM's former students. The second component of the initial effect is the added non-labor income of the businesses that employ former students of ULM.

We begin by estimating the portion of alumni who are employed in the workforce. To estimate the historical employment patterns of alumni in the region, we use the following sets of data or assumptions: 1) settling-in factors to determine how long it takes the average student to settle into a career;²¹ 2) death, retirement, and unemployment rates from the National Center for Health Statistics, the Social Security Administration, and the Bureau of Labor Statistics; and 3) regional migration data from the Internal Revenue Service.²² The result is the estimated portion of alumni from each previous year who were still actively employed in the region as of FY 2023-24.

The next step is to quantify the skills and human capital that alumni acquired from the university. We use the students' production of credits as a proxy for accumulated human capital. The average number of credits completed per student in FY 2023-24 was 18.4. To estimate the number of credits present in the workforce during the analysis year, we use the university's historical student headcount over the past 42 years, from FY 1982-83 to FY 2023-24. We apply a 42-year time horizon to include all alumni active in the regional workforce who have not reached the average retirement age of 67. The time horizon, or number of years in the workforce, is calculated by subtracting the average age of ULM's earliest student cohort for which we have data (25 years per Lightcast's study for FY 2021-22) from the retirement age of 67. However, because the alumni impact is based on credits achieved and not headcount, we calculate and use an average age per credit rather than per student. We inform this average age by the historical student average age from ULM's economic impact study conducted by Lightcast for FY 2021-22.

We multiply the 18.4 average credits per student by the headcounts that we estimate are still actively employed from each of the previous years.²³ Students who enroll at the university more than one year are counted at least twice in the historical enrollment data. However, credits remain distinct regardless of when and by whom they were earned, so there is no duplication in the credit counts. We estimate there are approximately 2.7 million credits from alumni active in the workforce.

Next, we estimate the value of the credits, or the skills and human capital acquired by ULM alumni. This is done using the *incremental* added labor income stemming from the students' higher wages. The incremental added labor income is the difference between the wage earned by ULM alumni and the alternative wage they would have earned had they not attended ULM. Using the regional incremental earnings, credits required, and

21 Settling-in factors are used to delay the onset of the benefits to students in order to allow time for them to find employment and settle into their careers. In the absence of hard data, we assume a range between one and three years for students who graduate with a certificate or a degree, and between one and five years for returning students.

22 According to a study performed by Pew Research Center, people who have already moved are more likely to move again than people who do not move. Therefore, migration rates are dampened to account for the idea that if they do not move in the first two years after leaving the university, then they are less likely to migrate out compared to the average person.

23 This assumes the average level of study from past years is equal to the level of study of students today. Lightcast used data provided by ULM for a previous study to estimate students' credit load in prior years.

distribution of credits at each level of study, we estimate the average value per credit to equal \$203. This value represents the regional average incremental increase in wages that alumni of ULM received during the analysis year for every credit they completed.

Because workforce experience leads to increased productivity and higher wages, the value per credit varies depending on the students' workforce experience, with the highest value applied to the credits of students who had been employed the longest by FY 2023-24, and the lowest value per credit applied to students who were just entering the workforce. More information on the theory and calculations behind the value per credit appears in Appendix 6. In determining the amount of added labor income attributable to alumni, we multiply the credits of former students in each year of the historical time horizon by the corresponding average value per credit for that year, and then sum the products together. This calculation yields approximately \$545.9 million in gross labor income from increased wages received by former students in FY 2023-24 (as shown in Table 3.10).

Table 3.10: Number of credits in workforce and initial labor income created in Northeast Louisiana, FY 2023-24

Number of credits in workforce	2,690,419
Average value per credit	\$203
Initial labor income, gross	\$545,932,985
Adjustments for counterfactual scenarios	
Percent reduction for alternative education opportunities	15%
Percent reduction for adjustment for labor import effects	50%
Initial labor income, net	\$232,021,519

Source: Lightcast impact model

The next two rows in Table 3.10 show two adjustments used to account for counterfactual outcomes. As discussed above, counterfactual outcomes in economic analysis represent what would have happened if a given event had not occurred. The event in question is the education and training provided by ULM and subsequent influx of skilled labor into the regional economy. The first counterfactual scenario that we address is the adjustment for alternative education opportunities. In the counterfactual scenario where ULM does not exist, we assume a portion of ULM alumni would have received a comparable education elsewhere in the region or would have left the region and received a comparable education and then returned to the region. The incremental added labor income that accrues to those students cannot be counted toward the added labor income from ULM alumni. The adjustment for alternative education opportunities amounts to a 15% reduction of the \$545.9 million in added labor income. This means that 15% of the added labor income from ULM alumni would have been generated in the region anyway, even if the university did not exist. For more information on the alternative education adjustment, see Appendix 7.

The other adjustment in Table 3.10 accounts for the importation of labor. Suppose ULM did not exist and in consequence there were fewer skilled workers in the region. Businesses could still satisfy some of their need for skilled labor by recruiting from outside

ULM Alum: Dhu Thompson*

Dhu Thompson charts his own path. After graduating from Neville High School, Dhu enrolled at ULM, then called Northeast Louisiana University, with no particular career ambitions in mind. After one year, he took off and explored his love of the outdoors, backpacking and floating rivers, reveling in the beauty and promise of America. His respect for land conservation and a desire for something bigger landed Dhu at a few other higher education institutions across the US. Returning home, Dhu sought out the advice of NLU History professor Dr. Richard Chardkoff. Dhu needed an educational foundation and a degree to open doors, and he wanted to get started as soon as possible. He obtained a degree in liberal arts and immediately took a job with Central Bank as a management trainee. Dhu climbed the banking ladder, becoming an officer and then Vice President in Commercial Lending, before leaving to work in the plastics industry. After another brief stint with Bank One, Dhu realized he didn't want to be a banker and set his sights a little higher, purchasing a then financially-defunct plastics company in Stuttgart, Arkansas. Combining his appreciation for entrepreneurship and his love of conservation, Dhu believed he could turn the business around.

Delta Plastics manufactures polytube used to irrigate farms, and while the new irrigation style dominated the market, the used plastic clogged local landfills. Dhu developed a recycling system to convert the used tubing to post-consumer resin used in the garbage bag industry. Thompson founded Revolution Bag in 2010, and marketed the garbage bags directly

to users, acquiring clients such as New York City schools, Ford Motor Company, National Football League stadiums, Las Vegas casinos, and the Library of Congress. Now, Revolution Bag is one of the largest post-consumer resin manufacturers in the US. Thompson loved building a legacy and producing a product with the lowest carbon footprint on the market. He notes, "With entrepreneurs, money may be a measure of success, but they are more often motivated by a love of the game." Surrounding himself with smart, talented people, absent intimidation, and welcoming collective input grew his world and business immensely.

Thompson's banking background provided knowledge of business opportunities and financial requirements. In mentoring budding entrepreneurs with notable intelligence and financial acumen, Thompson often identifies a lack of experience and self-confidence. He recognizes achievements and peer recognition as the building blocks of self-confidence. Those things take time. Entrepreneurship tests a person's resolve and truly lets people see their capabilities. With a firm belief in challenging individuals, Thompson sponsors the Governor's Cup in Arkansas. The contest consists of university students from across that state working alongside entrepreneurial professors, presenting business models to a judging panel. The models involve marketing, financial analysis, everything required to bring an idea to a business form. Over the last 12 years of Thompson's involvement, several of those businesses have come to fruition.

In 2020, Dhu approached ULM President Ron Berry about starting a similar competition in Louisiana. With the help of Cathi Hemed, ULM's Director of External Initiatives, and members of the ULM Foundation, the first annual Pelican Cup will take place in April of this year. Fifteen applicants are competing at the inaugural event, and the awards ceremony will feature elevator-style pitch presentations. The top 3 winners will receive from \$10,000-\$25,000 dollars to bring their business ideas to the public. This event significantly opens the business world to young adults, many of whom possess no financial background. Exposure to business formats and plans brings potential entrepreneurs from various academic disciplines to the corporate table. The combination of a sound vision and a vigorous work ethic produces the corporate leaders of tomorrow. Thompson plans to grow the Pelican Cup, like its sister competition in Arkansas, to include numerous universities across the state of Louisiana.

As a proud ULM graduate, Dhu Thompson believes in the power of young minds. His legacy, alongside several successful businesses and an environmentally-friendly product, is giving back to his community and this region by inspiring student leaders to show up and show out. The Pelican Cup will provide the access and guidance that potential entrepreneurs need to become prosperous community leaders and innovators. Dhu Thompson is a testament to the potential of ULM graduates in changing their world for the better.

* Permission to reprint excerpts from published ULM alumni profiles has been granted by BayouLife Magazine, with source credit attributed to BayouLife.

Northeast Louisiana. We refer to this as the labor import effect. Lacking information on its possible magnitude, we assume 50% of the jobs that students fill at regional businesses could have been filled by workers recruited from outside the region if the university did not exist.²⁴ Consequently, the gross labor income must be adjusted to account for the importation of this labor, since it would have happened regardless of the presence of the university. We conduct a sensitivity analysis for this assumption in Appendix 1. With the 50% adjustment, the net added labor income added to the economy comes to \$232.0 million, as shown in Table 3.10.

24 A similar assumption is used by Walden (2014) in his analysis of the Cooperating Raleigh Colleges.

The \$232.0 million in added labor income appears under the initial effect in the labor income column of Table 3.11. To this we add an estimate for initial non-labor income. As discussed earlier in this section, businesses that employ former students of ULM see higher profits as a result of the increased productivity of their capital assets. To estimate this additional income, we allocate the initial increase in labor income (\$232.0 million) to the six-digit NAICS industry sectors where students are most likely to be employed. This allocation entails a process that maps completers in the region to the detailed occupations for which those completers have been trained, and then maps the detailed occupations to the six-digit industry sectors in the MR-SAM model.²⁵ Using a crosswalk created by National Center for Education Statistics (NCES) and the Bureau of Labor Statistics, we map the breakdown of the university's completers to the approximately

ULM Alum: Christina Davis*

Raised in Magnolia, Arkansas, Christina Bobo Davis hails from a family of ULM alumni. Christina always knew ULM was in her future. Having taken some accounting classes in high school, Christina declared accounting as her major. She planned on becoming a CPA, but quickly realized her passion was missing. Having been at ULM for two years at that point and taken many classes, Christina chose to pursue a degree in finance. Encouraged by her parents Eddie & Deborah Bobo to get a degree regardless of the subject, Christina dove into her finance studies and immersed herself in the college environment. Investing in the campus culture solidifies the college experience. Christina played the clarinet and received a scholarship to join ULM's The Sound of Today Marching Band. She was part of the Wind Ensemble and Tau Beta Sigma (TBS), a National Honorary Band Sorority. The Sorority provided support for college band programs and handled logistics prior to performances. The late Dr. Derle Long served as Band Director.

Dr. Long was one of several mentors along Christina's college journey. Dr. Paul Dunn was the Director of the Small Business Development Center (SBDC) on campus. He recruited Christina as a student worker, and she appreciated his straightforward manner. He helped Christina develop her thick skin. Dr. Dunn would say, "It doesn't matter who made the mistake. We have to fix it." Likewise, Alberta Green who worked in Career Services, encouraged Christina in school as well. Having also been in The Sound of Today, Alberta exemplified confidence and knowledge about campus life. Christina strived to exude the same. Dr. Michael Parker, head of the Finance Department, motivated Christina, as did Ms. Roshto, the head of Accounting. Ms. Roshto was Christina's favorite advisor, even after Christina changed her major to finance. Rather than simply reviewing class options, Roshto discussed Christina's future and had her best interest at heart.

In 2010, Christina took a job with the YMCA, first as an administrative assistant and then

as the Teen & Family Program Director. After taking a position at Chase in the Home Lending corporate building the next year, Christina got a call from Virendra Chhikara "VC" at SBDC, the current Center Director. Christina was hired back as a full-time consultant in 2014 and is now a Senior Business Consultant. In this position, Christina helps future and existing business owners. Future business owners display a passion for entrepreneurship, and Christina walks them through the process and helps them decide if they're ready to take the leap. Christina helps existing business owners prepare to gain capital and expand their businesses. She also provides business education workshops.

Working on the ULM campus for the last eight years, Christina loves being back at her alma mater. She runs into her former professors, classmates and appreciates ULM's familiarity. In a way, she feels like she is giving back to the university that gave so much to her.

* Permission to reprint excerpts from published ULM alumni profiles has been granted by BayouLife Magazine, with source credit attributed to BayouLife.

25 Completer data comes from the Integrated Postsecondary Education Data System (IPEDS), which organizes program completions according to the Classification of Instructional Programs (CIP) developed by the National Center for Education Statistics (NCES).

700 detailed occupations in the Standard Occupational Classification (SOC) system. Finally, we apply a matrix of wages by industry and by occupation from the MR-SAM model to map the occupational distribution of the \$232.0 million in initial labor income effects to the detailed industry sectors in the MR-SAM model.²⁶

Once these allocations are complete, we apply the ratio of non-labor to labor income provided by the MR-SAM model for each sector to our estimate of initial labor income. This computation yields an estimated \$58.6 million in added non-labor income attributable to the university's alumni. Summing initial labor and non-labor income together provides the total initial effect of alumni productivity in the Northeast Louisiana economy, equal to approximately \$290.6 million. To estimate multiplier effects, we convert the industry-specific income figures generated through the initial effect to sales using sales-to-income ratios from the MR-SAM model. We then run the values through the MR-SAM's multiplier matrix.

Table 3.11 shows the multiplier effects of alumni. Multiplier effects occur as alumni generate an increased demand for consumer goods and services through the expenditure of their higher wages. Further, as the industries where alumni are employed increase their output, there is a corresponding increase in the demand for input from the industries in the employers' supply chain. Together, the incomes generated by the expansions in business input purchases and household spending constitute the multiplier effect of the increased productivity of the university's alumni. The final results are \$132.6 million in added labor income and \$34.6 million in added non-labor income, for an overall total of \$167.1 million in multiplier effects. The grand total of the alumni impact is \$457.7 million in total added income, the sum of all initial and multiplier labor and non-labor income effects. This is equivalent to supporting 8,111 jobs.

Table 3.11: Alumni impact, FY 2023-24

	Labor income (thousands)	Non-labor income (thousands)	Total income (thousands)	Sales (thousands)	Jobs supported
Initial effect	\$232,022	\$58,561	\$290,583	\$554,820	5,126
Multiplier effect					
Direct effect	\$32,357	\$10,273	\$42,629	\$79,005	765
Indirect effect	\$9,426	\$2,931	\$12,357	\$22,670	233
Induced effect	\$90,787	\$21,370	\$112,157	\$209,849	1,986
Total multiplier effect	\$132,569	\$34,574	\$167,143	\$311,523	2,985
Total impact (initial + multiplier)	\$364,591	\$93,135	\$457,726	\$866,344	8,111

Source: Lightcast impact model

²⁶ For example, if the MR-SAM model indicates that 20% of jobs in SOC 15-1252 (Software Developers) occur in NAICS 541512 (Computer Systems Design Services) in the region, we allocate 20% of the initial labor income effect under SOC 15-1252 to NAICS 541512.

Total ULM impact

The total economic impact of ULM on Northeast Louisiana can be generalized into two broad types of impacts. First, on an annual basis, ULM generates a flow of spending that has a significant impact on the regional economy. The impacts of this spending are captured by the operations, research, entrepreneurial, visitor, and student spending impacts, along with the volunteerism impact. While not insignificant, these impacts do not capture the true purpose of ULM. The fundamental mission of ULM is to foster human capital. Every year, a new cohort of former ULM students adds to the stock of human capital in the region, and a portion of alumni continues to add to the regional economy.

Table 3.12 displays the grand total impacts of ULM on the Northeast Louisiana economy in FY 2023–24. For context, the percentages of ULM compared to the total labor income, total non-labor income, combined total income, sales, and jobs in Northeast Louisiana, as presented in Table 2.3 and Figure 2.3, are included. The total added value of ULM is **\$617.6 million**, equivalent to **4.5%** of the GRP of Northeast Louisiana. By comparison, this contribution that the university provides on its own is nearly as large as the entire Construction industry in the region. ULM's total impact supported **10,464 jobs** in FY 2023–24. For perspective, this means that **one out of every 18 jobs** in Northeast Louisiana is supported by the activities of ULM and its students.

Table 3.12: Total ULM impact, FY 2023–24

	Labor income (thousands)	Non-labor income (thousands)	Total income (thousands)	Sales (thousands)	Jobs supported
Operations spending	\$98,507	\$9,662	\$108,169	\$173,893	1,255
Research spending	\$1,148	\$138	\$1,286	\$2,063	17
Spin-off companies	\$11,165	\$5,444	\$16,609	\$28,489	381
Visitor spending	\$1,011	\$745	\$1,756	\$7,672	43
Student spending	\$19,279	\$12,718	\$31,997	\$119,443	652
Volunteerism	\$98	\$7	\$105	\$177	5
Alumni	\$364,591	\$93,135	\$457,726	\$866,344	8,111
Total impact	\$495,799	\$121,850	\$617,648	\$1,198,080	10,464
% of the Northeast Louisiana economy	5.4%	2.7%	4.5%	4.0%	5.5%

Source: Lightcast impact model

These impacts from the university and its students stem from different industry sectors and spread throughout the regional economy. Table 3.13 displays the total impact of ULM by each industry sector based on their two-digit NAICS code. The table shows the total impact of operations, research, spin-off companies, visitors, students, volunteerism, and alumni, as shown in Table 3.12, broken down by each industry sector's individual impact on the regional economy using processes outlined earlier in this chapter. By showing the impact from individual industry sectors, it is possible to see in finer detail the industries that drive the greatest impact on the regional economy from the university's activities and from where ULM alumni are employed. For example, the activities of ULM and its alumni in the Health Care & Social Assistance industry sector generated an impact of \$137.1 million in FY 2023-24.

Table 3.13: Total ULM impact by industry, FY 2023-24

Industry sector	Total income (thousands)	Jobs supported
Government, Education	\$152,893	2,138
Health Care & Social Assistance	\$137,104	2,460
Retail Trade	\$54,219	884
Government, Non-Education	\$41,137	533
Finance & Insurance	\$23,924	224
Construction	\$22,279	367
Accommodation & Food Services	\$22,218	650
Other Services (except Public Administration)	\$20,766	634
Information	\$20,765	134
Professional & Technical Services	\$17,467	286
Educational Services	\$17,300	581
Arts, Entertainment, & Recreation	\$16,417	770
Manufacturing	\$12,944	113
Wholesale Trade	\$11,702	69
Administrative & Waste Services	\$9,968	241
Utilities	\$8,897	25
Real Estate & Rental & Leasing	\$7,205	111

Investment analysis

The benefits generated by ULM affect the lives of many people. The most obvious beneficiaries are the university's students; they give up time and money to go to the university in return for a lifetime of higher wages and improved quality of life. But the benefits do not stop there. As students earn more, communities and citizens throughout Louisiana benefit from an enlarged economy and a reduced demand for social services. In the form of increased tax revenues and public sector savings, the benefits of education extend as far as the state and local government.

Investment analysis is the process of evaluating total costs and measuring these against total benefits to determine whether a proposed venture will be profitable. If benefits outweigh costs, the investment is worthwhile. If costs outweigh benefits, the investment will lose money and is thus considered infeasible. In this chapter, we evaluate ULM as a worthwhile investment from the perspectives of students, taxpayers, and society.

Student perspective

To enroll in postsecondary education, students pay for tuition and forgo monies that otherwise they would have earned had they chosen to work instead of attend college. From the perspective of students, education is the same as an investment. Students incur a cost, or put up a certain amount of money, with the expectation of receiving benefits in return. The total costs consist of the tuition and fees as well as student loan interest that students pay and the opportunity cost of forgone time and money. The benefits are the higher earnings that students receive as a result of their education.

Calculating student costs

Student costs consist of three main items: direct outlays, opportunity costs, and future principal and interest costs incurred from student loans. Direct outlays include tuition and fees, equal to \$46.2 million from Figure 2.1. Direct outlays also include the cost of books and supplies. On average, full-time students spent \$1,353 each on books and supplies during the reporting year.²⁷ Multiplying this figure by the number of full-time equivalents (FTEs) produced by ULM in FY 2023-24²⁸ generates a total cost of \$8.5 million for books and supplies.

In order to pay the cost of tuition, some students had to take out loans. These students not only incur the cost of tuition from the university but also incur the interest cost of taking out loans. In FY 2023-24, students received a total of \$36.4 million in federal loans to attend ULM.²⁹ Students pay back these loans along with interest over the span of several years in the future. Since students pay off these loans over time, they accrue no initial cost during the analysis year. Hence, to avoid double counting, the \$36.4 million in federal loans is subtracted from the costs incurred by students in FY 2023-24.

In addition to the cost of tuition, books, and supplies, students also experienced an opportunity cost of attending college during the analysis year. Opportunity cost is the most difficult component of student costs to estimate. It measures the value of time and earnings forgone by students who go to university rather than work. To calculate it, we need to know the difference between the students' full earning potential and what they actually earn while attending the university.

²⁷ Based on the data provided by ULM.

²⁸ A single FTE is equal to 30 credits for undergraduate students and 24 credits for graduate students, so there were 5,975 FTEs produced by students in FY 2023-24, equal to 177,211 credits divided by the weighted average number of credits per student.

²⁹ Due to data limitations, only federal loans are considered in this analysis.

Student costs

Out-of-pocket expenses

Opportunity costs

Student benefits

Higher earnings from education

We derive the students' full earning potential by weighting the average annual earnings levels in Figure 2.4 according to the education level breakdown of the student population at the start of the analysis year.³⁰ However, the earnings levels in Figure 2.4 reflect what average workers earn at the midpoint of their careers, not while attending the university. Because of this, we adjust the earnings levels to the average age of the student population (24) to better reflect their wages at their current age.³¹ This calculation yields an average full earning potential of \$16,046 per student.

In determining how much students earn while enrolled in postsecondary education, an important factor to consider is the time that they actually spend on postsecondary education, since this is the only time that they are required to give up a portion of their earnings. We use the students' credit production as a proxy for time, under the assumption that the more credits students earn, the less time they have to work, and, consequently, the greater their forgone earnings. Overall, students attending ULM in FY 2023-24 earned an average of 21.2 credits per student (excluding dual credit high school students), which is approximately equal to 75% of a full academic year.³² We thus include no more than \$12,056 (or 75%) of the students' full earning potential in the opportunity cost calculations.

Another factor to consider is the students' employment status while enrolled in postsecondary education. It is estimated that 44% of students are employed.³³ For the remainder of students, we assume that they are either seeking work or planning to seek work once they complete their educational goals. By choosing to enroll, therefore, non-working students give up everything that they can potentially earn during the academic year (i.e., the \$12,056). The total value of their forgone earnings thus comes to \$51.9 million.

Working students are able to maintain all or part of their earnings while enrolled. However, many of them hold jobs that pay less than statistical averages, usually because those are the only jobs they can find that accommodate their course schedule. These jobs tend to be at entry level, such as restaurant servers or cashiers. To account for this, we assume that working students hold jobs that pay 78% of what they would have earned had they chosen to work full-time rather than go to college.³⁴ The remaining 22% comprises the percentage of their full earning potential that they forgo. Obviously, this assumption varies by person; some students forgo more and others less. Since we do not know the actual jobs that students hold while attending, the 22% in forgone earnings serves as a reasonable average.

30 This is based on students who reported their prior level of education to ULM. The prior level of education data was then adjusted to exclude dual credit high school students.

31 Further discussion on this adjustment appears in Appendix 6.

32 Equal to 21.2 credits divided by 30 for the proportion of undergraduate students and 24 for the proportion of graduate students, the assumed number of credits in a full-time academic year.

33 Based on data provided by ULM. This figure excludes dual credit high school students, who are not included in the opportunity cost calculations.

34 The 78% assumption is based on the average hourly wage of jobs commonly held by working students divided by the regional average hourly wage. Occupational wage estimates are published by the Bureau of Labor Statistics (see http://www.bls.gov/oes/current/oes_nat.htm).

Thus far we have discussed student costs during the analysis year. However, recall that students take out student loans to attend college during the year, which they will have to pay back over time. The amount they will be paying in the future must be a part of their decision to attend the university today. Students who take out loans are not only required to pay back the principal of the loan but to also pay back a certain amount in interest. The first step in calculating students' loan interest cost is to determine the payback time for the loans. The \$36.4 million in loans was awarded to 3,538 students, averaging \$10,283 per student in the analysis year. However, this figure represents only one year of loans. Because loan payback time is determined by total indebtedness, we assume that since ULM is a four-year university, students will be indebted four times that amount, or \$41,132 on average. According to the U.S. Department of Education, this level of indebtedness will take up to 25 years to pay back under the standard repayment plan.³⁵

This indebtedness calculation is used solely to estimate the loan payback period. Students will be paying back the principal amount of \$36.4 million over time. After taking into consideration the time value of money, this means that students will pay off a discounted present value of \$18.4 million in principal over the 25 years. In order to calculate interest, we only consider interest on the federal loans awarded to students

Table 4.1: Present value of student costs, FY 2023-24 (thousands)

Direct outlays in FY 2023-24	
Tuition and fees	\$46,224
Less federal loans received	-\$36,382
Books and supplies	\$8,543
Total direct outlays	\$18,386
Opportunity costs in FY 2023-24	
Earnings forgone by non-working students	\$51,931
Earnings forgone by working students	\$8,934
Less residual aid	-\$23,946
Total opportunity costs	\$36,919
Future student loan costs (present value)	
Student loan principal	\$18,435
Student loan interest	\$17,538
Total present value student loan costs	\$35,973
Total present value student costs	\$91,278

Source: Based on data provided by ULM and outputs of the Lightcast impact model. Residual aid data reflects FY 2022-23 given data limitations.

³⁵ Repayment period based on total education loan indebtedness, U.S. Department of Education, 2022. <https://studentaid.ed.gov/sa/repay-loans/understand/plans/standard>.

in FY 2023–24. Using the student discount rate of 4.9%³⁶ as our interest rate, we calculate that students will pay a total discounted present value of \$17.5 million in interest on student loans throughout the first 25 years of their working lifetime. The stream of these future interest costs together with the stream of loan payments is included in the costs of Column 5 of Table 4.2.

The steps leading up to the calculation of student costs appear in Table 4.1. Direct outlays amount to \$18.4 million, the sum of tuition and fees (\$46.2 million) and books and supplies (\$8.5 million), less federal loans received (\$36.4 million). Opportunity costs for working and non-working students amount to \$36.9 million, excluding \$23.9 million in offsetting residual aid that is paid directly to students.³⁷ Finally, we have the present value of future student loan costs, amounting to \$36.0 million between principal and interest. Summing direct outlays, opportunity costs, and future student loan costs together yields a total of \$91.3 million in present value student costs.

Linking education to earnings

Having estimated the costs of education to students, we weigh these costs against the benefits that students receive in return. The relationship between education and earnings is well documented and forms the basis for determining student benefits. As shown in Figure 2.4, state mean earnings levels at the midpoint of the average-aged worker's career increase as people achieve higher levels of education. The differences between state earnings levels define the incremental benefits of moving from one education level to the next.

A key component in determining the students' return on investment is the value of their future benefits stream; i.e., what they can expect to earn in return for the investment they make in education. We calculate the future benefits stream to the university's FY 2023–24 students first by determining their average annual increase in earnings, equal to \$34.4 million. This value represents the higher wages that accrue to students at the midpoint of their careers and is calculated based on the marginal wage increases of the credits that students complete while attending the university. Using the state of Louisiana earnings, the marginal wage increase per credit is \$194. For a full description of the methodology used to derive the \$34.4 million, see Appendix 6.

The second step is to project the \$34.4 million annual increase in earnings into the future, for as long as students remain in the workforce. We do this by using the extended Mincer function to predict the change in earnings at each point in an individual's working career.³⁸ The Mincer function originated from Mincer's seminal work on human capital (1958). The function estimates earnings using an individual's years of education and post-schooling experience. While some have criticized Mincer's earnings function, it is still upheld in recent data and has served as the foundation for a variety of research

³⁶ The student discount rate is derived from the three-year average of the baseline forecasts for the 10-year discount rate published by the Congressional Budget Office. See the Congressional Budget Office, Student Loan and Pell Grant Programs—May 2023 Baseline. <https://www.cbo.gov/data/baseline-projections-selected-programs>.

³⁷ Residual aid is the remaining portion of scholarship or grant aid distributed directly to a student after the university applies tuition and fees.

³⁸ Appendix 6 provides more information on the Mincer function and how it is used to predict future earnings growth.

pertaining to labor economics. Card (1999 and 2001) addresses a number of these criticisms using U.S. based research over the last three decades and concludes that any upward bias in the Mincer parameters is on the order of 10% or less. Thus, to account for any upward bias, we conservatively incorporate a 10% reduction in our projected earnings, otherwise known as the ability bias.

Further, due to inconsistencies in the original quadratic Mincer specification,³⁹ as noted above, we use an enhanced version of the Mincer function—a quartic specification—that, besides the education level and work experience variables, factors in demographic characteristics such as sex and race/ethnicity to project, as precisely as possible, the former students’ wage trajectories.⁴⁰ With the \$34.4 million representing the students’ higher earnings at the midpoint of their careers, we apply scalars from the Mincer function to yield a stream of projected future benefits that gradually increase from the time students enter the workforce, peak shortly after the career midpoint, and then dampen slightly as students approach retirement at age 67. This earnings stream appears in Column 2 of Table 4.2.

As shown in Table 4.2, the \$34.4 million in gross higher earnings occurs around Year 14, which is the approximate midpoint of the students’ future working careers given the average age of the student population and an assumed retirement age of 67. In accordance with the Mincer function, the gross higher earnings that accrue to students in the years leading up to the midpoint are less than \$34.4 million and the gross higher earnings in the years after the midpoint are greater than \$34.4 million.

The final step in calculating the students’ future benefits stream is to net out the potential benefits generated by students who are either not yet active in the workforce or who leave the workforce over time. This adjustment appears in Column 3 of Table 4.2 and represents the percentage of the FY 2023-24 student population that will be employed in the workforce in a given year. Note that the percentages in the first five years of the time horizon are relatively lower than those in subsequent years. This is because many students delay their entry into the workforce, either because they are still enrolled at the university or because they are unable to find a job immediately upon graduation. Accordingly, we apply a set of “settling-in” factors to account for the time needed by students to find employment and settle into their careers. As discussed in Chapter 3, settling-in factors delay the onset of the benefits by one to three years for students who graduate with a certificate or a degree and by one to five years for degree-seeking students who do not complete during the analysis year.

Beyond the first five years of the time horizon, students will leave the workforce for any number of reasons, whether death, retirement, or unemployment. We estimate the rate of attrition using the same data and assumptions applied in the calculation

of the attrition rate in the economic impact analysis of Chapter 3.⁴¹ The likelihood of leaving the workforce increases as students age, so the attrition rate is more aggressive near the end of the time horizon than in the beginning. Column 4 of Table 4.2 shows the net higher earnings to students after accounting for both the settling-in patterns and attrition.

Return on investment for students

Having estimated the students' costs and their future benefits stream, the next step is to discount the results to the present to reflect the time value of money. For the student perspective we assume a discount rate of 4.9% (see below). Because students tend to rely upon debt to pay for education—i.e. they are negative savers—their discount rate is based upon student loan interest rates.⁴² In Appendix 1, we conduct a sensitivity analysis of this discount rate. The present value of the benefits is then compared to student costs to derive the investment analysis results, expressed in terms of a benefit-cost ratio, rate of return, and payback period. The investment is feasible if returns match or exceed the minimum threshold values; i.e., a benefit-cost ratio greater than 1.0, a rate of return that exceeds the discount rate, and a reasonably short payback period.

Discount rate

The discount rate is a rate of interest that converts future costs and benefits to present values. For example, \$1,000 in higher earnings realized 30 years in the future is worth much less than \$1,000 in the present. All future values must therefore be expressed in present value terms in order to compare them with investments (i.e., costs) made today. The selection of an appropriate discount rate, however, can become an arbitrary and controversial undertaking. As suggested in economic theory, the discount rate should reflect the investor's opportunity cost of capital, i.e., the rate of return one could reasonably expect to obtain from alternative investment schemes. In this study we assume a 4.9% discount rate from the student perspective and a 0.7% discount rate from the perspectives of taxpayers and society.

In Table 4.2, the net higher earnings of students yield a cumulative discounted sum of approximately \$486.3 million, the present value of all of the future earnings increments (see the bottom section of Column 4). This may also be interpreted as the gross capital asset value of the students' higher earnings stream. In effect, the aggregate FY 2023–24 student body is rewarded for its investment in ULM with a capital asset valued at \$486.3 million.

The students' cost of attending the university is shown in Column 5 of Table 4.2, equal to a present value of \$91.3 million. Comparing the cost with the present value of benefits

⁴¹ See the discussion of the alumni impact in Chapter 3. The main sources for deriving the attrition rate are the National Center for Health Statistics, the Social Security Administration, and the Bureau of Labor Statistics. Note that we do not account for migration patterns in the student investment analysis because the higher earnings that students receive as a result of their education will accrue to them regardless of where they find employment.

⁴² The student discount rate is derived from the most recent three-year average baseline forecasts for the 10-year Treasury rate published by the Congressional Budget Office. See the Congressional Budget Office, Student Loan and Pell Grant Programs—May 2023 Baseline. <https://www.cbo.gov/data/baseline-projections-selected-programs>.

yields a student benefit-cost ratio of 5.3 (equal to \$486.3 million in benefits divided by \$91.3 million in costs).

Another way to compare the same benefits stream and associated cost is to compute the rate of return. The rate of return indicates the interest rate that a bank would have to pay a depositor to yield an equally attractive stream of future payments.⁴³ Table 4.2 shows students of ULM earning average returns of 20.7% on their investment of time and money. This is a favorable return compared, for example, to approximately 1% on a standard bank savings account, or 10.1% on stocks and bonds (30-year average return).

Note that returns reported in this study are real returns, not nominal. When a bank promises to pay a certain rate of interest on a savings account, it employs an implicitly nominal rate. Bonds operate in a similar manner. If it turns out that the inflation rate is higher than the stated rate of return, then money is lost in real terms. In contrast, a real rate of return is on top of inflation. For example, if inflation is running at 3% and a nominal percentage of 5% is paid, then the real rate of return on the investment is only 2%. In Table 4.2, the 20.7% student rate of return is a real rate. With an inflation rate of 2.6% (the average rate reported over the past 20 years as per the

ULM students see an average rate of return of **20.7%** for their investment of time and money.

Growing the future of teaching

Unlike the national trend of declining enrollment in education programs, the number of students pursuing teaching degrees at ULM has stabilized and even grown over the past three years. A key driver of this success is the Educators Rising (ER) Program, launched five years ago. ER is a community-based initiative that partners with high school chapters to provide early teacher preparation, supported by local and state stakeholders. By fostering teacher diversity and quality at the high school level, the program aims to attract more students to the teaching profession.

Using a nationally tested curriculum, ER offers high school students valuable insights into a career in education. Participants who

successfully complete the program can earn up to 12 hours of college credit in education courses, enabling them to graduate with their undergraduate degree in less than four years.

What began with a few local school districts has now expanded statewide. In February 2024, ULM hosted a statewide conference that welcomed over 600 students from ER clubs. This momentum is expected to continue, contributing to an increased number of qualified teachers graduating from Louisiana institutions over the next decade.

Further strengthening the teacher pipeline, Louisiana Delta Community College (LDCC), in collaboration with ULM, launched the Grow Your Own Teacher Apprenticeship Program in

Fall 2023. Funded by a congressional grant from Congresswoman Julia Letlow, this initiative helps address teacher shortages in both urban and rural areas by removing financial and logistical barriers to earning a teaching degree. Six school districts—Caldwell, East Carroll, West Carroll, Lincoln, Monroe City, and Union—are currently participating, offering apprentices in-person mentoring. Students begin their coursework at LDCC, transition to ULM in their second year, and complete internships at their current schools. By investing in innovative teacher preparation programs, ULM is playing a pivotal role in developing the next generation of educators for Louisiana and beyond.

⁴³ Rates of return are computed using the familiar internal rate-of-return calculation. Note that, with a bank deposit or stock market investment, the depositor puts up a principal, receives in return a stream of periodic payments, and then recovers the principal at the end. Someone who invests in education, on the other hand, receives a stream of periodic payments that include the recovery of the principal as part of the periodic payments, but there is no principal recovery at the end. These differences notwithstanding comparable cash flows for both bank and education investors yield the same internal rate of return.

U.S. Department of Commerce, Consumer Price Index), the corresponding nominal rate of return is 23.3%, higher than what is reported in Table 4.2.

The payback period is defined as the length of time it takes to entirely recoup the initial investment.⁴⁴ Beyond that point, returns are what economists would call pure costless rent. As indicated in Table 4.2, students at ULM see, on average, a payback period of 6.9 years, meaning 6.9 years after their initial investment of forgone earnings and out-of-pocket costs, they will have received enough higher future earnings to fully recover those costs (Figure 4.1).

Figure 4.1: Student payback period

Source: Lightcast impact model

⁴⁴ Payback analysis is generally used by the business community to rank alternative investments when safety of investments is an issue. Its greatest drawback is it does not account for the time value of money. The payback period is calculated by dividing the cost of the investment by the net return per period. In this study, the cost of the investment includes tuition and fees plus the opportunity cost of time; it does not account for student living expenses.

Taxpayer perspective

From the taxpayer perspective, the pivotal step is to determine the public benefits that specifically accrue to state and local government. For example, benefits resulting from earnings growth are limited to increased state and local tax payments. Similarly, savings related to improved health, reduced crime, and fewer welfare and unemployment claims, discussed below, are limited to those received strictly by state and local government. In all instances, benefits to private residents, local businesses, or the federal government are excluded.

Growth in state tax revenues

As a result of their time at ULM, students earn more because of the skills they learned while attending the university, and businesses earn more because student skills make capital more productive (buildings, machinery, and everything else). This in turn raises profits and other business property income. Together, increases in labor and non-labor (i.e., capital) income are considered the effect of a skilled workforce. These in turn increase tax revenues since state and local government is able to apply tax rates to higher earnings.

Estimating the effect of ULM on increased tax revenues begins with the present value of the students' future earnings stream, which is displayed in Column 4 of Table 4.2. To these net higher earnings, we apply a multiplier derived from Lightcast's MR-SAM model to estimate the added labor income created in the state as students and businesses spend their higher earnings.⁴⁵ As labor income increases, so does non-labor income, which consists of monies gained through investments. To calculate the growth in non-labor income, we multiply the increase in labor income by a ratio of the Louisiana gross state product to total labor income in the state. We also include the spending impacts discussed in Chapter 3 that were created in FY 2023-24 from operations, research, visitor, and student spending, measured at the state level. To each of these, we apply the prevailing tax rates so we capture only the tax revenues attributable to state and local government from this additional revenue.

Not all of these tax revenues may be counted as benefits to the state, however. Some students leave the state during the course of their careers, and the higher earnings they receive as a result of their education leave the state with them. To account for this dynamic, we combine student settlement data from the university with data on migration patterns from the Internal Revenue Service to estimate the number of students who will leave the state workforce over time.

⁴⁵ For a full description of the Lightcast MR-SAM model, see Appendix 5.

Taxpayer costs

State/local funding

Taxpayer benefits

Increased tax revenue

Avoided costs to
state/local government

We apply another reduction factor to account for the students' alternative education opportunities. This is the same adjustment that we use in the calculation of the alumni impact in Chapter 3 and is designed to account for the counterfactual scenario where ULM does not exist. The assumption in this case is that any benefits generated by students who could have received an education even without the university cannot be counted as new benefits to society. For this analysis, we assume an alternative education variable of 15%, meaning that 15% of the student population at the university would have generated benefits anyway even without the university. For more information on the alternative education variable, see Appendix 7.

We apply a final adjustment factor to account for the "shutdown point" that nets out benefits that are not directly linked to the state and local government costs of supporting the university. As with the alternative education variable discussed under the alumni impact, the purpose of this adjustment is to account for counterfactual scenarios. In this case, the counterfactual scenario is where state and local government funding for ULM did not exist and ULM had to derive the revenue elsewhere. To estimate this shutdown point, we apply a sub-model that simulates the students' demand curve for education by reducing state and local support to zero and progressively increasing student tuition and fees. As student tuition and fees increase, enrollment declines. For ULM, the shutdown point adjustment is 5%, meaning that the added tax revenue results are discounted by 5% to account for the benefits that the university could still potentially generate even without taxpayer support. The shutdown point adjustment may vary from year to year and is dependent on the proportion of revenues from state and local government appropriations to the total amount of government funding. For more information on the theory and methodology behind the estimation of the shutdown point, see Appendix 9.

After adjusting for attrition, alternative education opportunities, and the shutdown point, we calculate the present value of the future added tax revenues that occur in the state, equal to \$98.7 million. Recall from the discussion of the student return on investment that the present value represents the sum of the future benefits that accrue each year over the course of the time horizon, discounted to current year dollars to account for the time value of money. Given that the stakeholder in this case is the public sector, we use the discount rate of 0.7%. This is the three-year average of the real Treasury interest rate reported by the Office of Management and Budget (OMB) for 30-year investments, and in Appendix 1, we conduct a sensitivity analysis of this discount rate.⁴⁶

Government savings

In addition to the creation of higher tax revenues to the state and local government, education is statistically associated with a variety of lifestyle changes that generate social savings, also known as external or incidental benefits of education. These represent the avoided costs to the government that otherwise would have been drawn from

⁴⁶ Office of Management and Budget. Discount Rates for Cost-Effectiveness, Lease Purchase, and Related Analyses. Revised February 17, 2023. Accessed March 2024. https://www.whitehouse.gov/wp-content/uploads/2023/02/M-23-12-Appendix-C-Update_Discount-Rates.pdf

public resources absent the education provided by ULM. Government savings appear in Figure 4.2 and Table 4.3 and break down into three main categories: 1) health savings, 2) crime savings, and 3) income assistance savings. Health savings include avoided medical costs that would have otherwise been covered by state and local government. Crime savings consist of avoided costs to the justice system (i.e., police protection, judicial and legal, and corrections). Income assistance benefits comprise avoided costs due to the reduced number of welfare and unemployment insurance claims.

The model quantifies government savings by calculating the probability at each education level that individuals will have poor health, commit crimes, or claim welfare and unemployment benefits. Deriving the probabilities involves assembling data from a variety of studies and surveys analyzing the correlation between education and health, crime, and income assistance at the national and state level. We spread the probabilities across the education ladder and multiply the marginal differences by the number of students who achieved credits at each step. The sum of these marginal differences counts as the upper bound measure of the number of students who, due to the education they received at the university, will not have poor health, commit crimes, or demand income assistance. We dampen these results by the ability bias adjustment discussed earlier in the student perspective section and in Appendix 6 to account for factors (besides education) that influence individual behavior. We then multiply the marginal effects of education by the associated costs of health, crime, and income assistance.⁴⁷ Finally, we apply the same adjustments for attrition, alternative education, and the shutdown point to derive the net savings to the government. Total government savings appear in Figure 4.2 and sum to \$43.2 million.

In addition to the creation of **higher tax revenues** to the state and local government, education is statistically associated with a variety of lifestyle changes that generate **social savings**.

Table 4.3: Present value of added tax revenue and government savings (thousands)

Added tax revenue	\$98,661
Government savings	
Health-related savings	\$25,807
Crime-related savings	\$16,631
Income assistance savings	\$783
Total government savings	\$43,221
Total taxpayer benefits	\$141,882

Source: Lightcast impact model

Table 4.3 displays all benefits to taxpayers. The first row shows the added tax revenues created in the state, equal to \$98.7 million, from students' higher earnings, increases in non-labor income, and spending impacts. The sum of the government savings and the added income in the state is \$141.9 million, as shown in the bottom row of Table 4.3. These savings continue to accrue in the future as long as the FY 2023-24 student population of ULM remains in the workforce.

Figure 4.2: Present value of government savings

Source: Lightcast impact model

⁴⁷ For a full list of the data sources used to calculate the social externalities, see the Resources and References section. See also Appendix 10 for a more in-depth description of the methodology.

Return on investment for taxpayers

Taxpayer costs are reported in Table 4.4 and come to \$58.6 million, equal to the contribution of state and local government to ULM. In return for their public support, taxpayers are rewarded with an investment benefit-cost ratio of 2.4 ($= \$141.9 \text{ million} \div \58.6 million), indicating a profitable investment.

At 6.1%, the rate of return to state and local taxpayers is favorable. Given that the stakeholder in this case is the public sector, we use the mentioned earlier discount rate of 0.7%, the three-year average of the real Treasury interest rate reported by the Office of Management and Budget for 30-year investments. This is the return governments are assumed to be able to earn on generally safe investments of unused funds, or alternatively, the interest rate for which governments, as relatively safe borrowers, can obtain funds. A rate of return of 0.7% would mean that the university just pays its own way. In principle, governments could borrow monies used to support ULM and repay the loans out of the resulting added taxes and reduced government expenditures. A rate of return of 6.1%, on the other hand, means that ULM not only pays its own way, but also generates a surplus that the state and local government can use to fund other programs.

Additionally, a benefit-cost ratio greater than 1.0 indicates a good public investment since the taxes from ULM student higher earnings and reduced government expenditures not only recover taxpayer costs but grow the Louisiana tax base.

A benefit-cost ratio of **2.4** means ULM is a good public investment since the taxes from ULM student higher earnings and reduced government expenditures not only recover taxpayer costs but grow the Louisiana tax base.

Table 4.4: Projected benefits and costs, taxpayer perspective

Social perspective

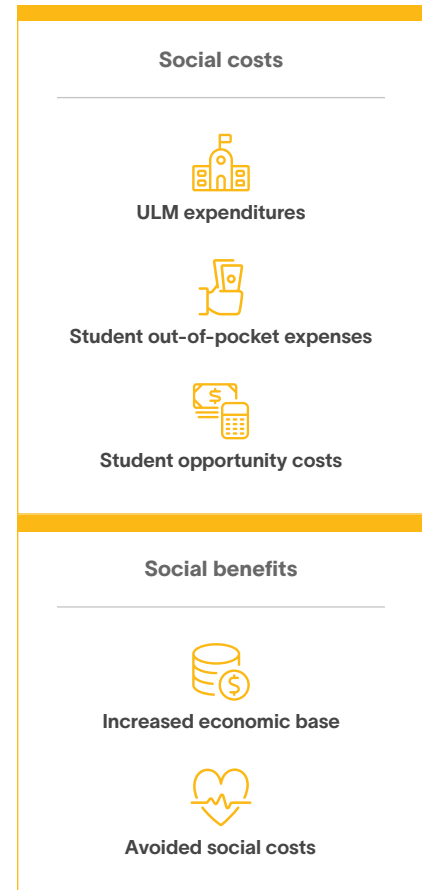

Louisiana benefits from the education that ULM provides through the earnings that students create in the state and through the savings that they generate through their improved lifestyles. To receive these benefits, however, members of society must pay money and forgo services that they otherwise would have enjoyed if ULM did not exist. Society's investment in ULM stretches across a number of investor groups, from students to employers to taxpayers. We weigh the benefits generated by ULM to these investor groups against the total social costs of generating those benefits. The total social costs include all ULM expenditures, all student expenditures (including interest on student loans) less tuition and fees, and all student opportunity costs, totaling a present value of \$214.2 million.

On the benefits side, any benefits that accrue to Louisiana as a whole—including students, employers, taxpayers, and anyone else who stands to benefit from the activities of ULM—are counted as benefits under the social perspective. We group these benefits under the following broad headings: 1) increased earnings in the state, and 2) social externalities stemming from improved health, reduced crime, and reduced unemployment in the state (see the Beekeeper Analogy box for a discussion of externalities). Both of these benefits components are described more fully in the following sections.

Growth in state economic base

In the process of absorbing the newly acquired skills of students who attend ULM, not only does the productivity of the Louisiana workforce increase, but so does the productivity of its physical capital and assorted infrastructure. Students earn more because of the skills they learned while attending the university, and businesses earn more because student skills make capital more productive (buildings, machinery, and everything else). This in turn raises profits and other business property income. Together, increases in labor and non-labor (i.e., capital) income are considered the effect of a skilled workforce.

Estimating the effect of ULM on the state's economic base follows a similar process used when calculating increased tax revenues in the taxpayer perspective. However, instead of looking at just the tax revenue portion, we include all of the added earnings and business output. First, we calculate the students' future higher earnings stream. We factor in student attrition and alternative education opportunities to arrive at net higher earnings. We again apply multipliers derived from Lightcast's MR-SAM model to estimate the added labor and non-labor income created in the state as students and businesses spend their higher earnings and as businesses generate additional profits from this increased output (added student and business income in Figure 4.3).

We also include the operations, research, visitor, and student spending impacts discussed in Chapter 3 that were created in FY 2023–24, measured at the state level (added income from university activities in Figure 4.3). The shutdown point does not apply to the growth of the economic base because the social perspective captures not only the state and local taxpayer support to the university, but also the support from the students and other non-government sources.

Using this process, we calculate the present value of the future added income that occurs in the state, equal to \$1.2 billion. Recall from the discussion of the student and taxpayer return on investment that the present value represents the sum of the future benefits that accrue each year over the course of the time horizon, discounted to current year dollars to account for the time value of money. As stated in the taxpayer perspective, given that the stakeholder in this case is the public sector, we use the discount rate of 0.7%.

Beekeeper analogy

Beekeepers provide a classic example of positive externalities (sometimes called “neighborhood effects”). The beekeeper’s intention is to make money selling honey. Like any other business, receipts must at least cover operating costs. If they don’t, the business shuts down.

But from society’s standpoint, there is more. Flowers provide the nectar that bees need for honey production, and smart beekeepers locate near flowering sources such as orchards. Nearby orchard owners, in turn, benefit as the bees spread the pollen necessary for orchard growth and fruit production. This is an uncompensated external benefit of beekeeping,

and economists have long recognized that society might actually do well to subsidize activities that produce positive externalities, such as beekeeping.

Educational institutions are like beekeepers. While their principal aim is to provide education and raise people’s earnings, in the process they create an array of external benefits. Students’ health and lifestyles are improved, and society indirectly benefits just as orchard owners indirectly benefit from beekeepers. In an effort to provide a more comprehensive report of the benefits generated by education, the model accounts for many of these external social benefits.

Social savings

Similar to the government savings discussed above, society as a whole sees savings due to external or incidental benefits of education. These represent the avoided costs that otherwise would have been drawn from private and public resources absent the education provided by ULM. Social benefits appear in Table 4.5 and break down into three main categories: 1) health savings, 2) crime savings, and 3) income assistance savings. These are similar to the categories from the taxpayer perspective above, although health savings now also include lost productivity and other effects associated with smoking, obesity, depression, and substance abuse. In addition to avoided costs to the justice system, crime savings also consist of avoided victim costs and benefits stemming from the added productivity of individuals who otherwise would have been incarcerated. Income assistance savings comprise the avoided government costs due to the reduced number of welfare and unemployment insurance claims.

Inspiring the future: Centennial Scholars Summit launches at ULM

ULM hosted its inaugural [Centennial Scholars](#) Summit in June, welcoming over 300 sixth-grade students from Monroe City and Ouachita Parish schools to campus. These students make up the Centennial Scholars—a special cohort who will form ULM’s freshman class of 2031, marking the university’s 100th anniversary. Throughout the summit, students explored academic disciplines and career paths that align with their unique talents and interests, offering them an early glimpse into the possibilities that higher education can provide.

ULM began engaging with this group in 2022 by gifting each student a copy of [There’s a Bridge on the Bayou](#)—a book written by ULM Development Officer, Cindy Foust and illustrated by ULM Executive Creative Director, Srdjan Marjanovic. The book, which highlights the transformative power of education through the story of President Berry, was accompanied by a \$500 scholarship toward each student’s first semester at ULM in 2031.

ULM remains committed to supporting the Centennial Scholars as they progress through middle and high school. According to Dr. Amy Weems, Assistant Professor ULM School of Education, the university aims to provide at least one educational opportunity and one student-life-related opportunity for the Centennial Scholars each year, continuing to invest in their journey toward college and lifelong success.

Table 4.5 displays the results of the analysis. The first row shows the increased economic base in the state, equal to \$1.2 billion, from students’ higher earnings and their multiplier effects, increases in non-labor income, and spending impacts. Social savings appear next, beginning with a breakdown of savings related to health. These include savings due to a reduced demand for medical treatment and social services,

Table 4.5: Present value of the future increased economic base and social savings in the state (thousands)

Increased economic base	\$1,192,318
Social savings	
Health	
Smoking	\$86,821
Obesity	\$25,118
Depression	\$32,054
Substance abuse	\$47,158
Total health savings	\$191,151
Crime	
Criminal justice system savings	\$17,475
Crime victim savings	\$703
Added productivity	\$2,335
Total crime savings	\$20,513
Income assistance	
Welfare savings	\$596
Unemployment savings	\$239
Total income assistance savings	\$835
Total social savings	\$212,500
Total, increased economic base + social savings	\$1,404,818

Source: Lightcast impact model

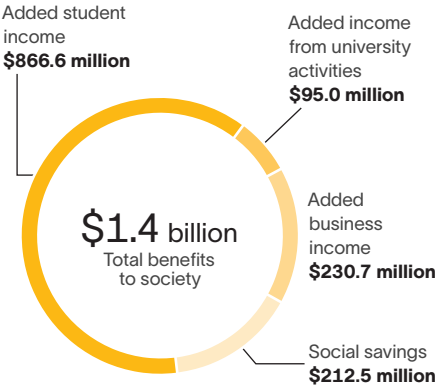

improved worker productivity and reduced absenteeism, and a reduced number of vehicle crashes and fires induced by alcohol or smoking-related incidents. These savings amount to \$191.2 million. Crime savings amount to \$20.5 million, including savings associated with a reduced number of crime victims, added worker productivity, and reduced expenditures for police and law enforcement, courts and administration of justice, and corrective services. Finally, the present value of the savings related to income assistance amounts to \$835.2 thousand, stemming from a reduced number of persons in need of welfare or unemployment benefits. All told, social savings amounted to \$212.5 million in benefits to communities and citizens in Louisiana.

The sum of the social savings and the increased state economic base is \$1.4 billion, as shown in the bottom row of Table 4.5 and in Figure 4.3. These savings accrue in the future as long as the FY 2023-24 student population of ULM remains in the workforce.

Return on investment for society

Table 4.6 presents the stream of benefits accruing to the Louisiana society and the total social costs of generating those benefits. Comparing the present value of the benefits and the social costs, we have a benefit-cost ratio of 6.6. This means that for every dollar invested in an education from ULM, whether it is the money spent on operations of the university or money spent by students on tuition and fees, an average of \$6.60 in benefits will accrue to society in Louisiana.⁴⁸

Figure 4.3: Present value of benefits to society

ULM and U.S. Army ERDC forge educational partnership to advance STEM collaboration

On March 25, 2024, ULM signed an Education Partnership Agreement with the U.S. Army Engineer Research and Development Center (ERDC) in Vicksburg, Mississippi. This agreement establishes a framework for cooperative educational initiatives between ULM and ERDC, including the sharing of laboratory equipment and collaboration on research projects.

According to the agreement, “The supportive relationship between ULM and ERDC is established in recognition of the importance of science and technology education to the future political and economic well-being of the nation, as well as the significance of ULM to the business, industrial, and government institutions in this region.”

Pending programmatic approval, ULM’s partnership with the U.S. Army Engineer Research and Development Center (ERDC) will expand the project’s scope, focusing on environmental modeling, flood planning, and wildfire risk management. These efforts will improve real-time weather modeling, leading to faster response times and better decision-making.

The partnership aims to enhance and promote education in Science, Technology, Engineering, and Mathematics (STEM) disciplines. ULM programs that may benefit from this collaboration include Unmanned Aircraft Systems Management, Strategic Communications, Public Administration, Educational Leadership, Business Administration, Atmospheric Science, Toxicology, Computer Science, and more.

- Key aspects of this partnership include:
- ERDC laboratory personnel assisting in course development and instruction;
 - ULM faculty and students participating in ERDC research projects;
 - ERDC providing academic and career mentorship to ULM students; and
 - The mutual sharing of resources and research materials.

The Educational Partnership Agreement will remain in effect for five years, fostering innovation and workforce development in STEM fields.

48 The rate of return is not reported for the social perspective because the beneficiaries of the investment are not necessarily the same as the original investors.

With and without social savings

Earlier in this chapter, social benefits attributable to education (improved health, reduced crime, and reduced demand for income assistance) were defined as externalities that are incidental to the operations of ULM. Some would question the legitimacy of including these benefits in the calculation of rates of return to education, arguing that only the tangible benefits (higher earnings) should be counted. Table 4.4 and Table 4.6 are inclusive of social benefits reported as attributable to ULM. Recognizing the other point of view, Table 4.7 shows rates of return for both the taxpayer and social perspectives exclusive of social benefits. As indicated, returns are still above threshold levels (a net present value greater than zero and a benefit-cost ratio greater than 1.0), confirming that taxpayers and society as a whole receive value from investing in ULM.

Table 4.7: Taxpayer and social perspectives with and without social savings

	Including social savings	Excluding social savings
Taxpayer perspective		
Net present value (millions)	\$83.3	\$40.1
Benefit-cost ratio	2.4	1.7
Internal rate of return	6.1%	3.5%

Chapter 5:

Conclusion

WHILE ULM ADDS VALUE to Northeast Louisiana beyond the economic impact outlined in this study, the value of ULM's impact in terms of dollars and cents is an important component of the university's value as a whole. In order to fully assess ULM's value to the regional economy, this report has evaluated the university from the perspectives of economic impact analysis and investment analysis.

From an economic impact perspective, we calculated that ULM generates a total economic impact of **\$617.6 million** in total added income for the regional economy. This represents the sum of several different impacts, including the university's:

- Operations spending impact (\$108.2 million);
- Research spending impact (\$1.3 million);
- Spin-off company impact (\$16.6 million);
- Visitor spending impact (\$1.8 million);
- Student spending impact (\$32.0 million);
- Volunteerism impact (\$104.6 thousand); and
- Alumni impact (\$457.7 million).

One out of every 18 jobs in Northeast Louisiana is supported by the activities of ULM and its students.

The total impact of \$617.6 million is equivalent to approximately **4.5%** of the total GRP of Northeast Louisiana and is equivalent to supporting **10,464 jobs**. For perspective, this means that **one out of every 18 jobs** in Northeast Louisiana is supported by the activities of ULM and its students.

Since ULM's activity represents an investment by various parties, including students, taxpayers, and society as a whole, we also evaluated the university as an investment to see the value it provides to these investors. For each dollar invested by students, taxpayers, and society, ULM offers a benefit of **\$5.30**, **\$2.40**, and **\$6.60**, respectively. These results indicate that ULM is an attractive investment to students with rates of return that exceed alternative investment opportunities. At the same time, the presence of the university expands the state economy and creates a wide range of positive social benefits that accrue to taxpayers and society in general within Louisiana.

Modeling the impact of the university is subject to many factors, the variability of which we considered in our sensitivity analysis (Appendix 1). With this variability accounted for, we present the findings of this study as a robust picture of the economic value of ULM.

Lightcast provides colleges and universities with labor market data that help create better outcomes for students, businesses, and communities. Our data, which cover more than 99% of the U.S. workforce, are compiled from a wide variety of government sources, job postings, and online profiles and résumés. Hundreds of institutions use Lightcast to align programs with regional needs, drive enrollment, connect students with in-demand careers, track their alumni's employment outcomes, and demonstrate their institution's economic impact on their region. Visit lightcast.io/solutions/education to learn more or connect with us.

Appendix 1: Sensitivity analysis

Sensitivity analysis measures the extent to which a model's outputs are affected by hypothetical changes in the background data and assumptions. This is especially important when those variables are inherently uncertain. This analysis allows us to identify a plausible range of potential results that would occur if the value of any of the variables is in fact different from what was expected. In this chapter we test the sensitivity of the model to the following input factors: 1) the alternative education variable, 2) the labor import effect variable, 3) the student employment variables, 4) the discount rate, and 5) the retained student variable.

Alternative education variable

The alternative education variable (15%) accounts for the counterfactual scenario where students would have to seek a similar education elsewhere absent the publicly-funded university in the region. Given the difficulty in accurately specifying the alternative education variable, we test the sensitivity of the taxpayer and social investment analysis results to its magnitude. Variations in the alternative education assumption are calculated around base case results listed in the middle column of Table A1.1. Next, the model brackets the base case assumption on either side with a plus or minus 10%, 25%, and 50% variation in assumptions. Analyses are then repeated introducing one change at a time, holding all other variables constant. For example, an increase of 10% in the alternative education assumption (from 15% to 17%) reduces the taxpayer perspective rate of return from 6.1% to 5.9%. Likewise, a decrease of 10% (from 15% to 14%) in the assumption increases the rate of return from 6.1% to 6.2%.

Table A1.1: Sensitivity analysis of alternative education variable, taxpayer and social perspectives

% variation in assumption	-50%	-25%	-10%	Base case	10%	25%	50%
Alternative education variable	8%	11%	14%	15%	17%	19%	23%
Taxpayer perspective							
Net present value (millions)	\$96.7	\$90.0	\$86.0	\$83.3	\$80.7	\$76.6	\$70.0
Rate of return	6.8%	6.4%	6.2%	6.1%	5.9%	5.7%	5.3%
Benefit-cost ratio	2.65	2.54	2.47	2.42	2.38	2.31	2.19
Social perspective							
Net present value (millions)	\$1,315	\$1,253	\$1,215	\$1,191	\$1,166	\$1,129	\$1,067
Benefit-cost ratio	7.14	6.85	6.67	6.56	6.44	6.27	5.98

Based on this sensitivity analysis, the conclusion can be drawn that ULM investment analysis results from the taxpayer and social perspectives are not very sensitive to relatively large variations in the alternative education variable. As indicated, results are

still above threshold levels (a net present value greater than zero and a benefit-cost ratio greater than 1.0), even when the alternative education assumption is increased by as much as 50% (from 15% to 23%). The conclusion is that although the assumption is difficult to specify, its impact on overall investment analysis results for the taxpayer and social perspectives is not very sensitive.

Labor import effect variable

The labor import effect variable only affects the alumni impact calculation in Table 3.11. In the model we assume a labor import effect variable of 50%, which means that 50% of the region's labor demands would have been satisfied without the presence of ULM. In other words, businesses that hired ULM students could have substituted some of these workers with equally-qualified people from outside the region had there been no ULM students to hire. Therefore, we attribute only the remaining 50% of the initial labor income generated by increased alumni productivity to the university.

Table A1.2 presents the results of the sensitivity analysis for the labor import effect variable. As explained earlier, the assumption increases and decreases relative to the base case of 50% by the increments indicated in the table. Alumni productivity impacts attributable to ULM, for example, range from a high of \$686.6 million at a -50% variation to a low of \$228.9 million at a +50% variation from the base case assumption. This means that if the labor import effect variable increases, the impact that we claim as attributable to alumni decreases. Even under the most conservative assumptions, the alumni impact on the Northeast Louisiana economy still remains sizeable.

Table A1.2: Sensitivity analysis of labor import effect variable

% variation in assumption	-50%	-25%	-10%	Base case	10%	25%	50%
Labor import effect variable	25%	38%	45%	50%	55%	63%	75%
Alumni impact (millions)	\$686.6	\$572.2	\$503.5	\$457.7	\$412.0	\$343.3	\$228.9

Student employment variables

Student employment variables are difficult to estimate because many students do not report their employment status or because universities generally do not collect this kind of information. Employment variables include the following: 1) the percentage of students who are employed while attending the university and 2) the percentage of earnings that working students receive relative to the earnings they would have received had they not chosen to attend the university. Both employment variables affect the investment analysis results from the student perspective.

Students incur substantial expense by attending ULM because of the time they spend not gainfully employed. Some of that cost is recaptured if students remain partially (or fully) employed while attending. It is estimated that 44% of students are employed.⁴⁹ This variable is tested in the sensitivity analysis by changing it first to 100% and then to 0%.

⁴⁹ Based on data provided by ULM. This figure excludes dual credit high school students, who are not included in the opportunity cost calculations.

The second student employment variable is more difficult to estimate. In this study we estimate that students who are working while attending the university earn only 78%, on average, of the earnings that they statistically would have received if not attending ULM. This suggests that many students hold part-time jobs that accommodate their ULM attendance, though it is at an additional cost in terms of receiving a wage that is less than what they otherwise might make. The 78% variable is an estimation based on the average hourly wages of the most common jobs held by students while attending college relative to the average hourly wages of all occupations in Northeast Louisiana. The model captures this difference in wages and counts it as part of the opportunity cost of time. As above, the 78% estimate is tested in the sensitivity analysis by changing it to 100% and then to 0%.

The changes generate results summarized in Table A1.3, with *A* defined as the percent of students employed and *B* defined as the percent that students earn relative to their full earning potential. Base case results appear in the shaded row; here the assumptions remain unchanged, with *A* equal to 44% and *B* equal to 78%. Sensitivity analysis results are shown in non-shaded rows. Scenario 1 increases *A* to 100% while holding *B* constant, Scenario 2 increases *B* to 100% while holding *A* constant, Scenario 3 increases both *A* and *B* to 100%, and Scenario 4 decreases both *A* and *B* to 0%.

Table A1.3: Sensitivity analysis of student employment variables

Variations in assumptions	Net present value (millions)	Internal rate of return	Benefit-cost ratio
Base case: <i>A</i> = 44%, <i>B</i> = 78%	\$395.0	20.7%	5.3
Scenario 1: <i>A</i> = 100%, <i>B</i> = 78%	\$435.6	40.2%	9.6
Scenario 2: <i>A</i> = 44%, <i>B</i> = 100%	\$403.9	22.8%	5.9
Scenario 3: <i>A</i> = 100%, <i>B</i> = 100%*	\$455.9	n/a	n/a
Scenario 4: <i>A</i> = 0%, <i>B</i> = 0%	\$363.1	16.1%	3.9

Note: *A* = percent of students employed; *B* = percent earned relative to statistical averages.

* In this scenario, costs are so low it is not appropriate to measure an internal rate of return or benefit-cost ratio.

- **Scenario 1:** Increasing the percentage of students employed (*A*) from 44% to 100%, the net present value, internal rate of return, and benefit-cost ratio improve to \$435.6 million, 40.2%, and 9.6, respectively, relative to base case results. Improved results are attributable to a lower opportunity cost of time; all students are employed in this case.
- **Scenario 2:** Increasing earnings relative to statistical averages (*B*) from 78% to 100%, the net present value, internal rate of return, and benefit-cost ratio results improve to \$403.9 million, 22.8%, and 5.9, respectively, relative to base case results; this strong improvement, again, is attributable to a lower opportunity cost of time.
- **Scenario 3:** Increasing both assumptions *A* and *B* to 100% simultaneously, the net present value improves to \$455.9 million, relative to base case results. This

scenario assumes that all students are fully employed and earning full salaries (equal to statistical averages) while attending classes.

- **Scenario 4:** Finally, decreasing both A and B to 0% reduces the net present value, internal rate of return, and benefit-cost ratio to \$363.1 million, 16.1%, and 3.9, respectively, relative to base case results. These results are reflective of an increased opportunity cost; none of the students are employed in this case.⁵⁰

It is strongly emphasized in this section that base case results are very attractive in that results are all above their threshold levels. As is clearly demonstrated here, results of the first three alternative scenarios appear much more attractive, although they overstate benefits. Results presented in Chapter 4 are realistic, indicating that investments in ULM generate excellent returns, well above the long-term average percent rates of return in stock and bond markets.

Discount rate

The discount rate is a rate of interest that converts future monies to their present value. In investment analysis, the discount rate accounts for two fundamental principles: 1) the time value of money, and 2) the level of risk that an investor is willing to accept. Time value of money refers to the value of money after interest or inflation has accrued over a given length of time. An investor must be willing to forgo the use of money in the present to receive compensation for it in the future. The discount rate also addresses the investors' risk preferences by serving as a proxy for the minimum rate of return that the proposed risky asset must be expected to yield before the investors will be persuaded to invest in it. Typically, this minimum rate of return is determined by the known returns of less risky assets where the investors might alternatively consider placing their money.

Table A1.4: Sensitivity analysis of discount rate

% variation in assumption	-50%	-25%	-10%	Base case	10%	25%	50%
Student perspective							
Discount rate	2.4%	3.7%	4.4%	4.9%	5.4%	6.1%	7.3%
Net present value (millions)	\$695.4	\$521.1	\$440.7	\$395.0	\$354.5	\$302.3	\$233.1
Benefit-cost ratio	8.62	6.71	5.83	5.33	4.88	4.31	3.55
Taxpayer perspective							
Discount rate	0.37%	0.55%	0.66%	0.73%	0.81%	0.92%	1.10%
Net present value (millions)	\$94.5	\$88.8	\$85.5	\$83.3	\$81.2	\$78.2	\$73.3
Benefit-cost ratio	2.61	2.52	2.46	2.42	2.39	2.33	2.25
Social perspective							
Discount rate	0.37%	0.55%	0.66%	0.73%	0.81%	0.92%	1.10%
Net present value (millions)	\$1,299	\$1,243	\$1,211	\$1,191	\$1,170	\$1,141	\$1,093
Benefit-cost ratio	7.08	6.81	6.66	6.56	6.46	6.32	6.09

⁵⁰ Note that reducing the percent of students employed to 0% automatically negates the percent they earn relative to full earning potential, since none of the students receive any earnings in this case.

In this study, we assume a 4.9% discount rate for students and a 0.7% discount rate for society and taxpayers.⁵¹ Similar to the sensitivity analysis of the alternative education variable, we vary the base case discount rates for students, taxpayers, and society on either side by increasing the discount rate by 10%, 25%, and 50%, and then reducing it by 10%, 25%, and 50%. Note that, because the payback period is based on the undiscounted cash flow, it is unaffected by changes in the discount rate.

As demonstrated in Table A1.4, an increase in the discount rate leads to a corresponding decrease in the expected returns, and vice versa. For example, increasing the student discount rate by 50% (from 4.9% to 7.3%) reduces the students' benefit-cost ratio from 5.3 to 3.6. Conversely, reducing the discount rate for students by 50% (from 4.9% to 2.4%) increases the benefit-cost ratio from 5.3 to 8.6. The sensitivity analysis results for taxpayers and society show the same inverse relationship between the discount rate and the benefit-cost ratio.

Retained student variable

The retained student variable only affects the student spending impact calculation in Table 3.8. For this analysis, we assume a retained student variable of 10%, which means that 10% of ULM's students who originated from Northeast Louisiana would have left the region for other opportunities, whether that be education or employment, if ULM did not exist. The money these retained students spent in the region for accommodation and other personal and household expenses is attributable to ULM.

Table A1.5 presents the results of the sensitivity analysis for the retained student variable. The assumption increases and decreases relative to the base case of 10% by the increments indicated in the table. The student spending impact is recalculated at each value of the assumption, holding all else constant. Student spending impacts attributable to ULM range from a high of \$33.3 million when the retained student variable is 15% to a low of \$30.7 million when the retained student variable is 5%. This means as the retained student variable decreases, the student spending attributable to ULM decreases. Even under the most conservative assumptions, the student spending impact on the Northeast Louisiana economy remains substantial.

Table A1.5: Sensitivity analysis of retained student variable

% variation in assumption	-50%	-25%	-10%	Base case	10%	25%	50%
Retained student variable	5%	8%	9%	10%	11%	13%	15%
Student spending impact (thousands)	\$30,684	\$31,340	\$31,735	\$31,997	\$32,260	\$32,654	\$33,311

⁵¹ These values are based on the three-year average of the baseline forecasts for the 10-year Treasury rate published by the Congressional Budget Office and the real Treasury interest rates reported by the Office of Management and Budget for 30-year investments. See the Congressional Budget Office "Table 5. Federal Student Loan Programs: Projected Interest Rates: CBO's July 2023 Baseline" and the Office of Management and Budget "Discount Rates for Cost-Effectiveness, Lease Purchase, and Related Analyses."

Appendix 2: Glossary of terms

Alternative education: A “with” and “without” measure of the percent of students who would still be able to avail themselves of education if the university under analysis did not exist. An estimate of 10%, for example, means that 10% of students do not depend directly on the existence of the university in order to obtain their education.

Alternative use of funds: A measure of how monies that are currently used to fund the university might otherwise have been used if the university did not exist.

Asset value: Capitalized value of a stream of future returns. Asset value measures what someone would have to pay today for an instrument that provides the same stream of future revenues.

Attrition rate: The rate at which students leave the workforce due to out-migration, unemployment, retirement, or death.

Benefit-cost ratio: Present value of benefits divided by present value of costs. If the benefit-cost ratio is greater than 1, then benefits exceed costs, and the investment is feasible.

Counterfactual scenario: What would have happened if a given event had not occurred. In the case of this economic impact study, the counterfactual scenario is a scenario where the university did not exist.

Demand: Relationship between the market price of education and the volume of education demanded (expressed in terms of enrollment). The law of the downward-sloping demand curve is related to the fact that enrollment increases only if the price (tuition and fees) is lowered, or conversely, enrollment decreases if price increases.

Discounting: Expressing future revenues and costs in present value terms.

Earnings (labor income): Income that is received as a result of labor; i.e., wages.

Economics: Study of the allocation of scarce resources among alternative and competing ends. Economics is not normative (what ought to be done), but positive (describes what is, or how people are likely to behave in response to economic changes).

Elasticity of demand: Degree of responsiveness of the quantity of education demanded (enrollment) to changes in market prices (tuition and fees). If a decrease in fees increases or decreases total enrollment by a significant amount, demand is elastic. If enrollment remains the same or changes only slightly, demand is inelastic.

Externalities: Impacts (positive and negative) for which there is no compensation. Positive externalities of education include improved social behaviors such as improved health, lower crime, and reduced demand for income assistance. Educational institutions do not receive compensation for these benefits, but benefits still occur because education is statistically proven to lead to improved social behaviors.

Gross regional product: Measure of the final value of all goods and services produced in a region after netting out the cost of goods used in production. Alternatively, gross regional product (GRP) equals the combined incomes of all factors of production; i.e., labor, land and capital. These include wages, salaries, proprietors' incomes, profits, rents, and other. Gross regional product is also sometimes called value added or added income.

Initial effect: Income generated by the initial injection of monies into the economy through the payroll of the university and the higher earnings of its students.

Input-output analysis: Relationship between a given set of demands for final goods and services and the implied amounts of manufactured inputs, raw materials, and labor that this requires. When educational institutions pay wages and salaries and spend money for supplies in the region, they also generate earnings in all sectors of the economy, thereby increasing the demand for goods and services and jobs. Moreover, as students enter or rejoin the workforce with higher skills, they earn higher salaries and wages. In turn, this generates more consumption and spending in other sectors of the economy.

Internal rate of return: Rate of interest that, when used to discount cash flows associated with investing in education, reduces its net present value to zero (i.e., where the present value of revenues accruing from the investment are just equal to the present value of costs incurred). This, in effect, is the breakeven rate of return on investment since it shows the highest rate of interest at which the investment makes neither a profit nor a loss.

Multiplier effect: Additional income created in the economy as the university and its students spend money in the region. It consists of the income created by the supply chain of the industries initially affected by the spending of the university and its students (i.e., the direct effect), income created by the supply chain of the initial supply chain (i.e., the indirect effect), and the income created by the increased spending of the household sector (i.e., the induced effect).

NAICS: The North American Industry Classification System (NAICS) classifies North American business establishments in order to better collect, analyze, and publish statistical data related to the business economy.

Net cash flow: Benefits minus costs, i.e., the sum of revenues accruing from an investment minus costs incurred.

Net present value: Net cash flow discounted to the present. All future cash flows are collapsed into one number, which, if positive, indicates feasibility. The result is expressed as a monetary measure.

Non-labor income: Income received from investments, such as rent, interest, and dividends.

Opportunity cost: Benefits forgone from alternative B once a decision is made to allocate resources to alternative A. Or, if individuals choose to attend college, they forgo earnings that they would have received had they chosen instead to work full-time. Forgone earnings, therefore, are the “price tag” of choosing to attend college.

Payback period: Length of time required to recover an investment. The shorter the period, the more attractive the investment. The formula for computing payback period is:

$$\text{Payback period} = \text{cost of investment} / \text{net return per period}$$

Appendix 3: Frequently asked questions (FAQs)

This appendix provides answers to some frequently asked questions about the results.

What is economic impact analysis?

Economic impact analysis quantifies the impact from a given economic event—in this case, the presence of a university—on the economy of a specified region.

What is investment analysis?

Investment analysis is a standard method for determining whether an existing or proposed investment is economically viable. This methodology is appropriate in situations where a stakeholder puts up a certain amount of money with the expectation of receiving benefits in return, where the benefits that the stakeholder receives are distributed over time, and where a discount rate must be applied in order to account for the time value of money.

Do the results differ by region, and if so, why?

Yes. Regional economic data are drawn from Lightcast's proprietary MR-SAM model, the Census Bureau, and other sources to reflect the specific earnings levels, jobs numbers, unemployment rates, population demographics, and other key characteristics of the region served by the university. Therefore, model results for the university are specific to the given region.

Are the funds transferred to the university increasing in value, or simply being re-directed?

Lightcast's approach is not a simple "rearranging of the furniture" where the impact of operations spending is essentially a restatement of the level of funding received by the university. Rather, it is an impact assessment of the additional income created in the region as a result of the university spending on payroll and other non-pay expenditures, net of any impacts that would have occurred anyway if the university did not exist.

How do my university's rates of return compare to that of other institutions?

In general, Lightcast discourages comparisons between institutions since many factors, such as regional economic conditions, institutional differences, and student demographics are outside of the university's control. It is best to compare the rate of return to the discount rates of 4.9% (for students) and 0.7% (for society and taxpayers), which can also be seen as the opportunity cost of the investment (since these stakeholder groups could be spending their time and money in other investment schemes besides education). If the rate of return is higher than the discount rate, the stakeholder groups can expect to receive a positive return on their educational investment.

Lightcast recognizes that some institutions may want to make comparisons. As a word of caution, if comparing to an institution that had a study commissioned by a firm other than Lightcast, then differences in methodology will create an “apples to oranges” comparison and will therefore be difficult. The study results should be seen as unique to each institution.

Lightcast conducted an economic impact study for my university a few years ago. Why have results changed?

Lightcast is a leading provider of economic impact studies and labor market data to educational institutions, workforce planners, and regional developers in the U.S. and internationally. Since 2000, Lightcast has completed over 3,000 economic impact studies for educational institutions in three countries. Along the way we have worked to continuously update and improve our methodologies to ensure that they conform to best practices and stay relevant in today's economy. The present study reflects the latest version of our model, representing the most up-to-date theory, practices, and data for conducting economic impact and investment analyses. Many of our former assumptions have been replaced with observed data, and we have researched the latest sources in order to update the background data used in our model. Additionally, changes in the data the university provides to Lightcast can influence the results of the study.

Net present value (NPV): How do I communicate this in laymen's terms?

Which would you rather have: a dollar right now or a dollar 30 years from now? That most people will choose a dollar now is the crux of net present value. The preference for a dollar today means today's dollar is therefore worth more than it would be in the future (in most people's opinion). Because the dollar today is worth more than a dollar in 30 years, the dollar 30 years from now needs to be adjusted to express its worth today. Adjusting the values for this “time value of money” is called discounting and the result of adding them all up after discounting each value is called net present value.

Internal rate of return (IRR): How do I communicate this in laymen's terms?

Using the bank as an example, an individual needs to decide between spending all of their paycheck today and putting it into savings. If they spend it today, they know what it is worth: \$1 = \$1. If they put it into savings, they need to know that there will be some sort of return to them for spending those dollars in the future rather than now. This is why banks offer interest rates and deposit interest earnings. This makes it so an individual can expect, for example, a 3% return in the future for money that they put into savings now.

Total economic impact: How do I communicate this in laymen's terms?

Big numbers are great but putting them into perspective can be a challenge. To add perspective, find an industry with roughly the same "% of GRP" as your university (Table 2.3). This percentage represents its portion of the total gross regional product in the region (similar to the nationally recognized gross domestic product but at a regional level). This allows the university to say that their single brick and mortar campus does just as much for the region as the entire Utilities *industry*, for example. This powerful statement can help put the large total impact number into perspective.

Appendix 4: Example of sales versus income

Lightcast's economic impact study differs from many other studies because we prefer to report the impacts in terms of income rather than sales (or output). Income is synonymous with value added or gross regional product (GRP). Sales include all the intermediary costs associated with producing goods and services. Income is a net measure that excludes these intermediary costs:

$$\text{Income} = \text{Sales} - \text{Intermediary Costs}$$

For this reason, income is a more meaningful measure of new economic activity than reporting sales. This is evidenced by the use of gross domestic product (GDP)—a measure of income—by economists when considering the economic growth or size of a country. The difference is GRP reflects a region and GDP a country.

To demonstrate the difference between income and sales, let us consider an example of a baker's production of a loaf of bread. The baker buys the ingredients such as eggs, flour, and yeast for \$2.00. He uses capital such as a mixer to combine the ingredients and an oven to bake the bread and convert it into a final product. Overhead costs for these steps are \$1.00. Total intermediary costs are \$3.00. The baker then sells the loaf of bread for \$5.00.

The sales amount of the loaf of bread is \$5.00. The income from the loaf of bread is equal to the sales amount less the intermediary costs:

$$\text{Income} = \$5.00 - \$3.00 = \$2.00$$

In our analysis, we provide context behind the income figures by also reporting the associated number of jobs. The impacts are also reported in sales and earnings terms for reference.

Appendix 5: Lightcast MR-SAM

Lightcast's MR-SAM represents the flow of all economic transactions in a given region. It replaces Lightcast's previous input-output (IO) model, which operated with some 1,000 industries, four layers of government, a single household consumption sector, and an investment sector. The old IO model was used to simulate the ripple effects (i.e., multipliers) in the regional economy as a result of industries entering or exiting the region. The MR-SAM model performs the same tasks as the old IO model, but it also does much more. Along with the same 1,000 industries, government, household, and investment sectors embedded in the old IO tool, the MR-SAM exhibits much more functionality, a greater amount of data, and a higher level of detail on the demographic and occupational components of jobs (16 demographic cohorts and about 750 occupations are characterized).

This appendix presents a high-level overview of the MR-SAM. Additional documentation on the technical aspects of the model is available upon request.

Data sources for the model

The Lightcast MR-SAM model relies on a number of internal and external data sources, mostly compiled by the federal government. What follows is a listing and short explanation of our sources. The use of these data will be covered in more detail later in this appendix.

Lightcast Data are produced from many data sources to produce detailed industry, occupation, and demographic jobs and earnings data at the local level. This information (especially sales-to-jobs ratios derived from jobs and earnings-to-sales ratios) is used to help regionalize the national matrices as well as to disaggregate them into more detailed industries than are normally available.

BEA Make and Use Tables (MUT) are the basis for input-output models in the U.S. The *make* table is a matrix that describes the amount of each commodity made by each industry in a given year. Industries are placed in the rows and commodities in the columns. The *use* table is a matrix that describes the amount of each commodity used by each industry in a given year. In the use table, commodities are placed in the rows and industries in the columns. The BEA produces two different sets of MUTs, the benchmark and the summary. The benchmark set contains about 500 sectors and is released every five years, with a five-year lag time (e.g., 2002 benchmark MUTs were released in 2007). The summary set contains about 80 sectors and is released every year, with a two-year lag (e.g., 2010 summary MUTs were released in late 2011/early 2012). The MUTs are used in the Lightcast MR-SAM model to produce an industry-by-industry matrix describing all industry purchases from all industries.

BEA Gross Domestic Product by State (GSP) describes gross domestic product from the value added (also known as added income) perspective. Value added is equal to employee compensation, gross operating surplus, and taxes on production and imports, less subsidies. Each of these components is reported for each state and an aggregate group of industries. This dataset is updated once per year, with a one-year lag. The Lightcast MR-SAM model makes use of this data as a control and pegs certain pieces of the model to values from this dataset.

BEA National Income and Product Accounts (NIPA) cover a wide variety of economic measures for the nation, including gross domestic product (GDP), sources of output, and distribution of income. This dataset is updated periodically throughout the year and can be between a month and several years old depending on the specific account. NIPA data are used in many of the Lightcast MR-SAM processes as both controls and seeds.

BEA Local Area Income (LPI) encapsulates multiple tables with geographies down to the county level. The following two tables are specifically used: CA05 (Personal income and earnings by industry) and CA91 (Gross flow of earnings). CA91 is used when creating the commuting submodel and CA05 is used in several processes to help with place-of-work and place-of-residence differences, as well as to calculate personal income, transfers, dividends, interest, and rent.

Bureau of Labor Statistics Consumer Expenditure Survey (CEX) reports on the buying habits of consumers along with some information as to their income, consumer unit, and demographics. Lightcast utilizes this data heavily in the creation of the national demographic by income type consumption on industries.

Census of Government's (CoG) state and local government finance dataset is used specifically to aid breaking out state and local data that is reported in the MUTs. This allows Lightcast to have unique production functions for each of its state and local government sectors.

Census' OnTheMap (OTM) is a collection of three datasets for the census block level for multiple years. **Origin-Destination (OD)** offers job totals associated with both home census blocks and a work census block. **Residence Area Characteristics (RAC)** offers jobs totaled by home census block. **Workplace Area Characteristics (WAC)** offers jobs totaled by work census block. All three of these are used in the commuting submodel to gain better estimates of earnings by industry that may be counted as commuting. This dataset has holes for specific years and regions. These holes are filled with Census' Journey-to-Work described later.

Census' Current Population Survey (CPS) is used as the basis for the demographic breakout data of the MR-SAM model. This set is used to estimate the ratios of demographic cohorts and their income for the three different income categories (i.e., wages, property income, and transfers).

Census' Journey-to-Work (JtW) is part of the 2000 Census and describes the amount of commuting jobs between counties. This set is used to fill in the areas where OTM does not have data.

Census' American Community Survey (ACS) Public Use Microdata Sample (PUMS) is the replacement for Census' long form and is used by Lightcast to fill the holes in the CPS data.

Oak Ridge National Lab (ORNL) County-to-County Distance Matrix (Skim Tree) contains a matrix of distances and network impedances between each county via various modes of transportation such as highway, railroad, water, and combined highway-rail. Also included in this set are minimum impedances utilizing the best combination of paths. The ORNL distance matrix is used in Lightcast's gravitational flows model that estimates the amount of trade between counties in the country.

Overview of the MR-SAM model

Lightcast's MR-SAM modeling system is a comparative static model in the same general class as RIMS II (Bureau of Economic Analysis) and IMPLAN (Minnesota Implan Group). The MR-SAM model is thus not an econometric model, the primary example of which is PolicyInsight by REMI. It relies on a matrix representation of industry-to-industry purchasing patterns originally based on national data which are regionalized with the use of local data and mathematical manipulation (i.e., non-survey methods). Models of this type estimate the ripple effects of changes in jobs, earnings, or sales in one or more industries upon other industries in a region.

The Lightcast MR-SAM model shows final equilibrium impacts—that is, the user enters a change that perturbs the economy and the model shows the changes required to establish a new equilibrium. As such, it is not a dynamic model that shows year-by-year changes over time (as REMI's does).

National SAM

Following standard practice, the SAM model appears as a square matrix, with each row sum exactly equaling the corresponding column sum. Reflecting its kinship with the standard Leontief input-output framework, individual SAM elements show accounting flows between row and column sectors during a chosen base year. Read across rows, SAM entries show the flow of funds into column accounts (also known as receipts or the appropriation of funds by those column accounts). Read down columns, SAM entries show the flow of funds into row accounts (also known as expenditures or the dispersal of funds to those row accounts).

The SAM may be broken into three different aggregation layers: broad accounts, sub-accounts, and detailed accounts. The broad layer is the most aggregate and will be covered first. Broad accounts cover between one and four sub-accounts, which in turn cover many detailed accounts. This appendix will not discuss detailed accounts directly because of their number. For example, in the industry broad account, there are two sub-accounts and over 1,000 detailed accounts.

Multi-regional aspect of the MR-SAM

Multi-regional (MR) describes a non-survey model that has the ability to analyze the transactions and ripple effects (i.e., multipliers) of not just a single region, but multiple regions interacting with each other. Regions in this case are made up of a collection of counties.

Lightcast's multi-regional model is built off of gravitational flows, assuming that the larger a county's economy, the more influence it will have on the surrounding counties' purchases and sales. The equation behind this model is essentially the same that Isaac Newton used to calculate the gravitational pull between planets and stars. In Newton's equation, the masses of both objects are multiplied, then divided by the distance separating them and multiplied by a constant. In Lightcast's model, the masses are replaced with the supply of a sector for one county and the demand for that same sector from another county. The distance is replaced with an impedance value that considers the distance, type of roads, rail lines, and other modes of transportation. Once this is calculated for every county-to-county pair, a set of mathematical operations is performed to make sure all counties absorb the correct amount of supply from every county and the correct amount of demand from every county. These operations produce more than 200 million data points.

Components of the Lightcast MR-SAM model

The Lightcast MR-SAM is built from a number of different components that are gathered together to display information whenever a user selects a region. What follows is a description of each of these components and how each is created. Lightcast's internally created data are used to a great extent throughout the processes described below, but its creation is not described in this appendix.

County earnings distribution matrix

The county earnings distribution matrices describe the earnings spent by every industry on every occupation for a year—i.e., earnings by occupation. The matrices are built utilizing Lightcast's industry earnings, occupational average earnings, and staffing patterns.

Each matrix starts with a region's staffing pattern matrix which is multiplied by the industry jobs vector. This produces the number of occupational jobs in each industry for the region. Next, the occupational average hourly earnings per job are multiplied by 2,080 hours, which converts the average hourly earnings into a yearly estimate. Then the matrix of occupational jobs is multiplied by the occupational annual earnings per job, converting it into earnings values. Last, all earnings are adjusted to match the known industry totals. This is a fairly simple process, but one that is very important. These matrices describe the place-of-work earnings used by the MR-SAM.

Commuting model

The commuting sub-model is an integral part of Lightcast's MR-SAM model. It allows the regional and multi-regional models to know what amount of the earnings can be

attributed to place-of-residence vs. place-of-work. The commuting data describe the flow of earnings from any county to any other county (including within the counties themselves). For this situation, the commuted earnings are not just a single value describing total earnings flows over a complete year but are broken out by occupation and demographic. Breaking out the earnings allows for analysis of place-of-residence and place-of-work earnings. These data are created using Bureau of Labor Statistics' OnTheMap dataset, Census' Journey-to-Work, BEA's LPI CA91 and CA05 tables, and some of Lightcast's data. The process incorporates the cleanup and disaggregation of the OnTheMap data, the estimation of a closed system of county inflows and outflows of earnings, and the creation of finalized commuting data.

National SAM

The national SAM as described above is made up of several different components. Many of the elements discussed are filled in with values from the national Z matrix—or industry-to-industry transaction matrix. This matrix is built from BEA data that describe which industries make and use what commodities at the national level. These data are manipulated with some industry standard equations to produce the national Z matrix. The data in the Z matrix act as the basis for the majority of the data in the national SAM. The rest of the values are filled in with data from the county earnings distribution matrices, the commuting data, and the BEA's National Income and Product Accounts.

One of the major issues that affect any SAM project is the combination of data from multiple sources that may not be consistent with one another. Matrix balancing is the broad name for the techniques used to correct this problem. Lightcast uses a modification of the "diagonal similarity scaling" algorithm to balance the national SAM.

Gravitational flows model

The most important piece of the Lightcast MR-SAM model is the gravitational flows model that produces county-by-county regional purchasing coefficients (RPCs). RPCs estimate how much an industry purchases from other industries inside and outside of the defined region. This information is critical for calculating all IO models.

Gravity modeling starts with the creation of an impedance matrix that values the difficulty of moving a product from county to county. For each sector, an impedance matrix is created based on a set of distance impedance methods for that sector. A distance impedance method is one of the measurements reported in the Oak Ridge National Laboratory's County-to-County Distance Matrix. In this matrix, every county-to-county relationship is accounted for in six measures: great-circle distance, highway impedance, rail miles, rail impedance, water impedance, and highway-rail-highway impedance. Next, using the impedance information, the trade flows for each industry in every county are solved for. The result is an estimate of multi-regional flows from every county to every county. These flows are divided by each respective county's demand to produce multi-regional RPCs.

Appendix 6: Value per credit and the Mincer function

Two key components in the analysis are 1) the value of the students' educational achievements, and 2) the change in that value over the students' working careers. Both of these components are described in detail in this appendix.

Value per credit

Typically, the educational achievements of students are marked by the credentials they earn. However, not all students who attended ULM in FY 2023-24 obtained a degree or certificate. Some returned the following year to complete their education goals, while others took a few courses and entered the workforce without graduating. As such, the only way to measure the value of the students' achievement is through their credits. This approach allows us to see the benefits to all students who attended the university, not just those who earned a credential.

To calculate the value per credit, we first determine how many credits are required to complete each education level. For example, assuming that there are 30 credits in an academic year, a student generally completes 120 credits in order to move from a high school diploma to a bachelor's degree, another 60 credits to move from a bachelor's degree to a master's degree, and so on. This progression of credits generates an education ladder beginning at the less than high school level and ending with the completion of a doctoral degree, with each level of education representing a separate stage in the progression.

The second step is to assign a unique value to the credits in the education ladder based on the wage differentials presented in Table 2.4.⁵² For example, the difference in regional earnings between a high school diploma and a bachelor's degree is \$18,500. We spread this \$18,500 wage differential across the 120 credits that occur between a high school diploma and a bachelor's degree, applying a ceremonial "boost" to the last credit in the stage to mark the achievement of the degree.⁵³ We repeat this process for each education level in the ladder.

⁵² The value per credit is calculated differently between the economic impact analysis and the investment analysis. The economic impact analysis uses the region as its background and, therefore, uses regional earnings to calculate value per credit, while the investment analysis uses the state as its backdrop and, therefore, uses state earnings. The methodology outlined in this appendix will use regional earnings; however, the same methodology is followed for the investment analysis when state earnings are used.

⁵³ Economic theory holds that workers that acquire education credentials send a signal to employers about their ability level. This phenomenon is commonly known as the sheepskin effect or signaling effect. The ceremonial boosts applied to the achievement of degrees in the Lightcast impact model are derived from Jaeger and Page (1996).

Next, we map the credit production of the FY 2023–24 student population to the education ladder. Table 2.2 provides information on the credit production of students attending ULM, broken out by educational achievement. In total, students completed 177,211 credits during the analysis year. We map each of these credits to the education ladder depending on the students' education level and the average number of credits they completed during the year. For example, bachelor's degree graduates are allocated to the stage between the associate degree and the bachelor's degree, and the average number of credits they completed informs the shape of the distribution curve used to spread out their total credit production within that stage of the progression.

The sum product of the credits earned at each step within the education ladder and their corresponding value yields the students' aggregate annual increase in income (ΔE), as shown in the following equation:

$$\Delta E = \sum_{i=1}^n e_i h_i \text{ where } i \in 1, 2, \dots, n$$

and n is the number of steps in the education ladder, e_i is the marginal earnings gain at step i , and h_i is the number of credits completed at step i .

Table A6.1 displays the result for the students' aggregate annual increase in income (ΔE), a total of \$31.9 million. By dividing this value by the students' total production of 177,211 credits during the analysis year, we derive an overall value of \$180 per credit.

Table A6.1: Aggregate annual increase in income of students and value per credit

Aggregate annual increase in income	\$31,932,833
Total credits in FY 2023–24	177,211
Value per credit	\$180

Source: Lightcast impact model

Mincer function

The \$180 value per credit in Table A6.1 only tells part of the story, however. Human capital theory holds that earnings levels do not remain constant; rather, they start relatively low and gradually increase as the worker gains more experience. Research also shows that the earnings increment between educated and non-educated workers grows through time. These basic patterns in earnings over time were originally identified by Jacob Mincer, who viewed the lifecycle earnings distribution as a function with the key elements being earnings, years of education, and work experience, with age serving as a proxy for experience.⁵⁴ While some have criticized Mincer's earnings function, it is still upheld in recent data and has served as the foundation for a variety of research pertaining to labor economics. Those critical of the Mincer function point to several unobserved factors such as ability, socioeconomic status, and family background that also help explain higher earnings. Failure to account for these factors results in what is known as an "ability bias." Research by Card (1999 and 2001) suggests that

54 See Mincer (1958 and 1974).

the benefits estimated using Mincer's function are biased upwards by 10% or less. As such, we reduce the estimated benefits by 10%.

We use IPUMS (originally the "Integrated Public Use Microdata Series") data to calculate Mincer coefficients. The database contains over 60 integrated, high precision samples of the American population drawn from 16 federal census, from the American Community Surveys of 2000 – present, and from the Puerto Rican Community Surveys of 2005 – present. By using this data, we are able to create demographic and education level-specific Mincer coefficients. These coefficients are used in a quartic equation, which explains earnings with the years of education and work experience variables accounting for demographic characteristics through interaction terms with sex and race and ethnicity.

Figure A6.1: Lifecycle change in earnings

Figure A6.1 illustrates several important points about the Mincer function. First, as demonstrated by the shape of the curves, an individual's earnings initially grow at an increasing rate, then grow at a decreasing rate, reach a maximum somewhere well after the midpoint of the working career, and then decline in later years. Second, individuals with higher levels of education reach their maximum earnings at an older age compared to individuals with lower levels of education (recall that age serves as a proxy for years of experience). And third, the benefits of education, as measured by the difference in earnings between education levels, increase with age.

In calculating the alumni impact in Chapter 3, we use the slope of the curve in Mincer's earnings function to condition the \$180 value per credit to the students' age and work experience. To the students just starting their career during the analysis year, we apply a lower value per credit; to the students in the latter half or approaching the end of their careers we apply a higher value per credit. The original \$180 value per credit applies only to the credit production of students precisely at the midpoint of their careers during the analysis year.

In Chapter 4 we again apply the Mincer function, this time to project the benefits stream of the FY 2023-24 student population into the future. Here too the value per credit is lower for students at the start of their career and higher near the end of it, in accordance with the scalars derived from the slope of the Mincer curve illustrated in Figure A6.1.

Appendix 7: Alternative education variable

In a scenario where the university did not exist, some of its students would still be able to avail themselves of an alternative comparable education. These students create benefits in the region even in the absence of the university. The alternative education variable accounts for these students and is used to discount the benefits we attribute to the university.

Recall this analysis considers only relevant economic information regarding the university. Considering the existence of various other academic institutions surrounding the university, we have to assume that a portion of the students could find alternative education and either remain in or return to the region. For example, some students may participate in online programs while remaining in the region. Others may attend an out-of-region institution and return to the region upon completing their studies. For these students—who would have found an alternative education and produced benefits in the region regardless of the presence of the university—we discount the benefits attributed to the university. An important distinction must be made here: the benefits from students who would find alternative education outside the region and not return to the region are *not* discounted. Because these benefits would not occur in the region without the presence of the university, they must be included.

In the absence of the university, we assume 15% of the university's students would find alternative education opportunities and remain in or return to the region. We account for this by discounting the alumni impact, the benefits to taxpayers, and the benefits to society in the region in Chapters 3 and 4 by 15%. In other words, we assume 15% of the benefits created by the university's students would have occurred anyway in the counterfactual scenario where the university did not exist. A sensitivity analysis of this adjustment is presented in Appendix 1.

Appendix 8: Overview of investment analysis measures

The appendix provides context to the investment analysis results using the simple hypothetical example summarized in Table A8.1 below. The table shows the projected benefits and costs for a single student over time and associated investment analysis results.⁵⁵

Table A8.1: Example of the benefits and costs of education for a single student

1	2	3	4	5	6
Year	Tuition	Opportunity cost	Total cost	Higher earnings	Net cash flow
1	\$1,500	\$20,000	\$21,500	\$0	-\$21,500
2	\$0	\$0	\$0	\$5,000	\$5,000
3	\$0	\$0	\$0	\$5,000	\$5,000
4	\$0	\$0	\$0	\$5,000	\$5,000
5	\$0	\$0	\$0	\$5,000	\$5,000
6	\$0	\$0	\$0	\$5,000	\$5,000
7	\$0	\$0	\$0	\$5,000	\$5,000
8	\$0	\$0	\$0	\$5,000	\$5,000
9	\$0	\$0	\$0	\$5,000	\$5,000
10	\$0	\$0	\$0	\$5,000	\$5,000
Net present value			\$21,500	\$35,753	\$14,253

Benefit-cost ratio
1.7

Internal rate of return
18.0%

Payback period (years)
4.2

Assumptions are as follows:

- Benefits and costs are projected out 10 years into the future (Column 1).
- The student attends the university for one year, and the cost of tuition is \$1,500 (Column 2).
- Earnings forgone while attending the university for one year (opportunity cost) come to \$20,000 (Column 3).

⁵⁵ Note that this is a hypothetical example. The numbers used are not based on data collected from an existing university.

- Together, tuition and earnings forgone cost sum to \$21,500. This represents the out-of-pocket investment made by the student (Column 4).
- In return, the student earns \$5,000 more per year than he otherwise would have earned without the education (Column 5).
- The net cash flow (NCF) in Column 6 shows higher earnings (Column 5) less the total cost (Column 4).
- The assumed going rate of interest is 4%, the rate of return from alternative investment schemes for the use of the \$21,500.

Results are expressed in standard investment analysis terms, which are as follows: the net present value, the internal rate of return, the benefit-cost ratio, and the payback period. Each of these is briefly explained below in the context of the cash flow numbers presented in Table A8.1.

Net present value

The student in Table A8.1 can choose either to attend college or to forgo post-secondary education and maintain his present employment. If he decides to enroll, certain economic implications unfold. Tuition and fees must be paid, and earnings will cease for one year. In exchange, the student calculates that with post-secondary education, his earnings will increase by at least the \$5,000 per year, as indicated in the table.

The question is simple: Will the prospective student be economically better off by choosing to enroll? If he adds up higher earnings of \$5,000 per year for the remaining nine years in Table A8.1, the total will be \$45,000. Compared to a total investment of \$21,500, this appears to be a very solid investment. The reality, however, is different. Benefits are far lower than \$45,000 because future money is worth less than present money. Costs (tuition plus earnings forgone) are felt immediately because they are incurred today, in the present. Benefits, on the other hand, occur in the future. They are not yet available. All future benefits must be discounted by the going rate of interest (referred to as the discount rate) to be able to express them in present value terms. Let us take a brief example. At 4%, the present value of \$5,000 to be received one year from today is \$4,807. If the \$5,000 were to be received in year 10, the present value would reduce to \$3,377. Put another way, \$4,807 deposited in the bank today earning 4% interest will grow to \$5,000 in one year; and \$3,377 deposited today would grow to \$5,000 in 10 years. An “economically rational” person would, therefore, be equally satisfied receiving \$3,377 today or \$5,000 10 years from today given the going rate of interest of 4%. The process of discounting—finding the present value of future higher earnings—allows the model to express values on an equal basis in future or present value terms.⁵⁶

⁵⁶ Technically, the interest rate is applied to compounding—the process of looking at deposits today and determining how much they will be worth in the future. The same interest rate is called a discount rate when the process is reversed—determining the present value of future earnings.

The goal is to express all future higher earnings in present value terms so that they can be compared to investments incurred today (in this example, tuition plus earnings forgone). As indicated in Table A8.1 the cumulative present value of \$5,000 worth of higher earnings between years 2 and 10 is \$35,753 given the 4% interest rate, far lower than the undiscounted \$45,000 discussed above.

The net present value of the investment is \$14,253. This is simply the present value of the benefits less the present value of the costs, or $\$35,753 - \$21,500 = \$14,253$. In other words, the present value of benefits exceeds the present value of costs by as much as \$14,253. The criterion for an economically worthwhile investment is that the net present value is equal to or greater than zero. Given this result, it can be concluded that, in this case, and given these assumptions, this particular investment in education is very strong.

Internal rate of return

The internal rate of return is another way of measuring the worth of investing in education using the same cash flows shown in Table A8.1. In technical terms, the internal rate of return is a measure of the average earning power of money used over the life of the investment. It is simply the interest rate that makes the net present value equal to zero. In the discussion of the net present value above, the model applies the going rate of interest of 4% and computes a positive net present value of \$14,253. The question now is what the interest rate would have to be in order to reduce the net present value to zero. Obviously, it would have to be higher—18.0% in fact, as indicated in Table A8.1. Or, if a discount rate of 18.0% were applied to the net present value calculations instead of the 4%, then the net present value would reduce to zero.

What does this mean? The internal rate of return of 18.0% defines a breakeven solution—the point where the present value of benefits just equals the present value of costs, or where the net present value equals zero. Or, at 18.0%, higher earnings of \$5,000 per year for the next nine years will earn back all investments of \$21,500 made plus pay 18.0% for the use of that money (\$21,500) in the meantime. Is this a good return? Indeed, it is. If it is compared to the 4% going rate of interest applied to the net present value calculations, 18.0% is far higher than 4%. It may be concluded, therefore, that the investment in this case is solid. Alternatively, comparing the 18.0% rate of return to the long-term 10.1% rate or so obtained from investments in stocks and bonds also indicates that the investment in education is strong relative to the stock market returns (on average).

Benefit-cost ratio

The benefit-cost ratio is simply the present value of benefits divided by present value of costs, or $\$35,753 \div \$21,500 = 1.7$ (based on the 4% discount rate). Of course, any change in the discount rate would also change the benefit-cost ratio. Applying the 18.0% internal rate of return discussed above would reduce the benefit-cost ratio to 1.0, the breakeven solution where benefits just equal costs. Applying a discount rate higher than the 18.0% would reduce the ratio to lower than 1.0, and the investment

would not be feasible. The 1.7 ratio means that a dollar invested today will return a cumulative \$1.70 over the ten-year time period.

Payback period

This is the length of time from the beginning of the investment (consisting of tuition and earnings forgone) until higher future earnings give a return on the investment made. For the student in Table A8.1, it will take roughly 4.2 years of \$5,000 worth of higher earnings to recapture his investment of \$1,500 in tuition and the \$20,000 in earnings forgone while attending the university. Higher earnings that occur beyond 4.2 years are the returns that make the investment in education in this example economically worthwhile. The payback period is a fairly rough, albeit common, means of choosing between investments. The shorter the payback period, the stronger the investment.

Appendix 9: Shutdown point

The investment analysis in Chapter 4 weighs the benefits generated by the university against the state taxpayer funding that the university receives to support its operations. An important part of this analysis is factoring out the benefits that the university would have been able to generate anyway, even without state and local taxpayer support. This adjustment is used to establish a direct link between what taxpayers pay and what they receive in return. If the university is able to generate benefits without taxpayer support, then it would not be a true investment.⁵⁷

The overall approach includes a sub-model that simulates the effect on student enrollment if the university loses its state and local funding and has to raise student tuition and fees in order to stay open. If the university can still operate without state and local support, then any benefits it generates at that level are discounted from total benefit estimates. If the simulation indicates that the university cannot stay open, however, then benefits are directly linked to costs, and no discounting applies. This appendix documents the underlying theory behind these adjustments.

State and local government support versus student demand for education

Figure A9.1 presents a simple model of student demand and state and local government support. The right side of the graph is a standard demand curve (D) showing student enrollment as a function of student tuition and fees. Enrollment is measured in terms of total credits and expressed as a percentage of the university's current credit production. Current student tuition and fees are represented by p' , and state and local government support covers $C\%$ of all costs. At this point in the analysis, it is assumed that the university has only two sources of revenues: 1) student tuition and fees and 2) state and local government support.

Figure A9.2 shows another important reference point in the model—where state and local government support is 0%, student tuition and fees are increased to p'' , and credit production is at $Z\%$ (less than 100%). The reduction in credits reflects the price elasticity of the students' demand for education, i.e., the extent to which the students' decision to attend the university is affected by the change in tuition and fees. Ignoring for the moment those issues concerning the university's minimum operating scale (considered below in the section called "Calculating benefits at the shutdown point"), the implication for the investment analysis is that benefits to state and local government

⁵⁷ Of course, as a public training provider, the university would not be permitted to continue without public funding, so the situation in which it would lose all state support is entirely hypothetical. The purpose of the adjustment factor is to examine the university in standard investment analysis terms by netting out any benefits it may be able to generate that are not directly linked to the costs of supporting it.

must be adjusted to net out the benefits that the university can provide absent state and local government support, represented as $Z\%$ of the university's current credit production in Figure A9.2.

Figure A9.1: Student demand and government funding by tuition and fees

Figure A9.2: Credit production and government funding by tuition and fees

To clarify the argument, it is useful to consider the role of enrollment in the larger benefit-cost model. Let B equal the benefits attributable to state and local government support. The analysis derives all benefits as a function of student enrollment, measured in terms of credits produced. For consistency with the graphs in this appendix, B is expressed as a function of the percent of the university's current credit production. Equation 1 is thus as follows:

$$1) \quad B = B(100\%)$$

This reflects the total benefits generated by enrollments at their current levels.

Consider benefits now with reference to Z . The point at which state and local government support is zero nonetheless provides for $Z\%$ (less than 100%) of the current enrollment, and benefits are symbolically indicated by the following equation:

$$2) \quad B = B(Z\%)$$

Inasmuch as the benefits in equation 2 occur with or without state and local government support, the benefits appropriately attributed to state and local government support are given by equation 3 as follows:

$$3) \quad B = B(100\%) - B(Z\%)$$

Calculating benefits at the shutdown point

Colleges and universities cease to operate when the revenue they receive from the quantity of education demanded is insufficient to justify their continued operations. This is commonly known in economics as the shutdown point.⁵⁸ The shutdown point is introduced graphically in Figure A9.3 as $S\%$. The location of point $S\%$ indicates that the university can operate at an even lower enrollment level than $Z\%$ (the point at which the university receives zero state and local government funding). State and local government support at point $S\%$ is still zero, and student tuition and fees have been raised to p''' . State and local government support is thus credited with the benefits given by equation 3, or $B = B(100\%) - B(Z\%)$. With student tuition and fees still higher than p''' , the university would no longer be able to attract enough students to keep the doors open, and it would shut down.

Figure A9.4 illustrates yet another scenario. Here, the shutdown point occurs at a level of credit production greater than $Z\%$ (the level of zero state and local government support), meaning some minimum level of state and local government support is needed for the university to operate at all. This minimum portion of overall funding is indicated by $S'\%$ on the left side of the chart, and as before, the shutdown point is indicated by $S\%$ on the right side of chart. In this case, state and local government support is appropriately credited with all the benefits generated by the university's credit production, or $B = B(100\%)$.

Figure A9.3: Shutdown point after zero government funding

Figure A9.4: Shutdown point before zero government funding

58 In the traditional sense, the shutdown point applies to firms seeking to maximize profits and minimize losses. Although profit maximization is not the primary aim of colleges and universities, the principle remains the same, i.e., that there is a minimum scale of operation required in order for colleges and universities to stay open.

Appendix 10: Social externalities

Education has a predictable and positive effect on a diverse array of social benefits. These, when quantified in dollar terms, represent significant social savings that directly benefit society communities and citizens throughout the region, including taxpayers. In this appendix we discuss the following three main benefit categories: 1) improved health, 2) reductions in crime, and 3) reduced demand for government-funded income assistance.

It is important to note that the data and estimates presented here should not be viewed as exact, but rather as indicative of the positive impacts of education on an individual's quality of life. The process of quantifying these impacts requires a number of assumptions to be made, creating a level of uncertainty that should be borne in mind when reviewing the results.

Health

Statistics show a correlation between increased education and improved health. The manifestations of this are found in five health-related variables: smoking, obesity, depression, and substance abuse. There are other health-related areas that link to educational attainment, but these are omitted from the analysis until we can invoke adequate (and mutually exclusive) databases and are able to fully develop the functional relationships between them.

Smoking

Despite a marked decline over the last several decades in the percentage of U.S. residents who smoke, a sizeable percentage of the U.S. population still smokes. The negative health effects of smoking are well documented in the literature, which identifies smoking as one of the most serious health issues in the U.S.

Figure A10.1 shows the prevalence of cigarette smoking among adults, 21 years and over, based on data provided by the National Survey on Drug use and Health.⁵⁹ The data include adults who reported smoking in the last month. As indicated, prevalence of cigarette smoking declines after high school diploma or high school equivalency level of education.

Figure A10.1: Prevalence of smoking among U.S. adults by education level

Source: National Survey on Drug Use and Health

⁵⁹ National Survey on Drug Use and Health. "Table 2.18B—Cigarette Use in Past Month: Among People Aged 12 or Older; by Age Group and Demographic Characteristics, Percentages, 2021 and 2022."

The National Survey on Drug Use and Health also reports the percentage of adults who are current smokers by state.⁶⁰ We use this information to create an index value by which we adjust the national prevalence data on smoking to each state. For example, 23.8% of Louisiana adults were smokers in 2022, relative to 16.7% for the nation. We thus apply a scalar 1.43 to the national probabilities of smoking in order to adjust them to the state of Louisiana.

Obesity

The rise in obesity and diet-related chronic diseases has led to increased attention on how expenditures relating to obesity have increased in recent years. The average cost of obesity-related medical conditions is calculated using information from the *Journal of Occupational and Environmental Medicine*, which reports incremental medical expenditures and productivity losses due to excess weight.⁶¹

Data for Figure A10.2 is derived from the National Center for Health Statistics which shows the prevalence of obesity among adults aged 20 years and over by education, gender, and ethnicity.⁶² As indicated, college graduates are less likely to be obese than individuals with a high school diploma. However, the prevalence of obesity among adults with some college is actually greater than those with just a high school diploma. In general, though, obesity tends to decline with increasing levels of education.

Depression

Capturing the full economic cost of mental illness is difficult because not all mental disorders have a correlation with education. For this reason, we only examine the economic costs associated with major depressive disorder (MDD), which comprise medical and pharmaceutical costs, workplace costs such as absenteeism, and suicide-related costs.⁶³

Figure A10.3 summarizes the prevalence of major depressive episodes (MDE) with severe impairment and treatment for depression among adults by education level, based on data provided by the National Survey on Drug Use and Health.⁶⁴ As shown, people with some college education are most likely to have an MDE with severe impairment and seek treatment for depression compared to those with other levels of educational attainment. People with a high school diploma or less, along with college graduates, are all fairly similar in the prevalence rates.

Substance abuse

The burden and cost of substance abuse is enormous in the U.S., but little is known about the magnitude of costs and effects at a national level. What is known is that the rate of people abusing substances is inversely proportional to their education level. The higher the education level, the less likely a person is to abuse or depend on illicit drugs. The probability that a person with less than a high school diploma will abuse drugs or alcohol is 17.8%, slightly larger than the probability of substance abuse for college graduates (16.1%). This relationship is presented in Figure A10.4 based on data supplied by the National Survey on Drug Use and Health.⁶⁵ Prevalence does not strictly decline at every education level. Health Costs associated with substance abuse include health, productivity, traffic collisions, fire, and research and prevention.⁶⁶

Crime

As people achieve higher education levels, they are statistically less likely to commit crimes. The analysis identifies the following three types of crime-related expenses: 1) criminal justice expenditures, including police protection, judicial and legal, and corrections, 2) victim costs, and 3) productivity lost as a result of time spent in jail or prison rather than working.

Figure A10.5 displays the educational attainment of the incarcerated population in the U.S. Data are derived from the breakdown of the inmate population by education level in federal, state, and local prisons as provided by the U.S. Bureau of Justice Statistics.⁶⁷

Victim costs comprise material, medical, physical, and emotional losses suffered by crime victims. Some of these costs are hidden, while others are available in various databases. Estimates of victim costs vary widely, attributable to differences in how the costs are measured. The lower end of the scale includes only tangible out-of-pocket costs, while the higher end includes intangible costs related to pain and suffering.⁶⁸

Yet another measurable cost is the economic productivity of people who are incarcerated and are thus not employed. The measurable productivity cost is simply the number of additional incarcerated people, who could have been in the labor force, multiplied by the average income of their corresponding education levels.

Income assistance

Statistics show that as education levels increase, the number of applicants for government-funded income assistance such as welfare and unemployment benefits declines. Welfare and unemployment claimants can receive assistance from a variety of different sources, including Temporary Assistance for Needy Families (TANF), Supplemental Nutrition Assistance Program (SNAP), Medicaid, Supplemental Security Income (SSI), and unemployment insurance.⁶⁹

Figure A10.6 relates the breakdown of TANF recipients by education level, derived from data provided by the U.S. Department of Health and Human Services.⁷⁰ As shown, the demographic characteristics of TANF recipients are weighted heavily toward the less than high school and high school categories, with a much smaller representation of individuals with greater than a high school education.

Unemployment rates also decline with increasing levels of education, as illustrated in Figure A10.7. These data are provided by the Bureau of Labor Statistics.⁷¹ As shown, unemployment rates range from 5.6% for those with less than a high school diploma to 1.8% for those at the graduate degree level or higher.
