

Math 116
Homework 07

Blake Farman
University of South Carolina

October 18, 2016

9.3

4. Simplify, and indicate where the simplification is valid:

(a) $\sin(\tan^{-1}(x))$

(b) $\tan(\sec^{-1}(x))$

(c) $\sec(\sin^{-1}(x))$

(d) $\sin(2\tan^{-1}(x))$

(Hint: Use the fact that $\sin(2x) = 2\sin(x)\cos(x)$)

10.4

2. Factor the following expression, if possible:

$$x^3 - 7x + 6$$

10.5

6. Rationalize the top or bottom, and simplify.

$$\frac{x^4 - 36}{x + \sqrt{6}}.$$

8. Let

$$f(x) = \frac{1}{\sqrt{2x}}.$$

Calculate

$$\frac{f(x+h) - f(x)}{h}$$

and simplify.

11.1

2. Let $f(x) = 2x^2 - 2x$.

(a) Compute $f(x+h)$.

(b) Simplify

$$\frac{f(x+h) - f(x)}{h}.$$
